How did Aeroflex fast-switching synthesizers get to be #1? It’s no mystery. First, we built the best products. The only ones, in fact, that have it all—high speed, low noise and wide bandwidth—in one package. Even our most basic models are 30 times faster and 10 times cleaner than the closest competitor.

Signal Sources

2023A/B, 2025 Signal Generators

With its level of performance, this compact general purpose signal generator delivers outstanding value for money.

- Wide frequency coverage:
  - 9 kHz to 1.2 GHz (2023A)
  - 9 kHz to 2.05 GHz (2023B)
  - 9 kHz to 2.51 GHz (2025)
- Excellent spectral purity
- Linear and logarithmic sweep mode
- RPP to 50 W
- Sine, triangular and square wave two tone modulation source
- RS-232 and GPIB control
- Comprehensive modulation:
  - AM, FM, ☐ M , Pulse & FSK
  - 3.9 kHz Bessel filtered FSK
- Optional +25 dBm RF output
- SINAD Measurement Option

The 2023A/B and 2025 signal generators are portable and lightweight, offering carrier frequencies from 9 kHz to 1.2 GHz (2023A), 9 kHz to 2.05 GHz (2023B) and 9 kHz to 2.51 GHz (2025) with a wide choice of modulation modes. The instruments are suitable for a wide range of applications in laboratory, production, and maintenance environments. The GPIB facility allows the unit to be included in ATE systems for faster manufacturing throughput. An RS-232 interface is provided with a command set in common with the GPIB to simplify remote control of the signal generator in basic test systems or via a modem.

Operation

Front panel control is achieved through a flexible combination of keyboard selection, cursor selection and a rotary control in conjunction with a clear and intuitive menu presentation on a bright panel display. This ensures the instrument can be set up into any desired mode of operation quickly and simply.

Frequency Selection

Frequency resolution of 1 Hz across the complete frequency range of 1.2 GHz, 2.05 GHz or 2.51 GHz ensures adequate resolution to characterize narrow band communication systems and components.

RF Output

Peak RF output levels of between +13 dBm and -140 dBm can be set accurately with a resolution of 0.1 dB. An attenuator hold function allows control of the RF output without introducing RF level dropouts from the step attenuator to facilitate testing of receiver squelch systems, and during EMI investigations. A RF level limit can be set to limit the output power to avoid damage to external, power sensitive devices. RF level offsets up to ±5 dB can be applied to counter the effects of test system losses etc. A carrier ON/OFF key is provided to completely disable the output.

50 W Protection

An electronic trip protects the generator output against reverse power of up to 50 W from a source with a VSWR’s of up to 5:1, preventing damage to output circuits if a RF transmitter or DC power supply is accidentally applied to the output connector. This feature contributes to long service life and low cost of ownership.

Size and Weight

The 2023A/B and 2025 occupy a full rack width, but only 2 units high to minimize rack occupancy in manufacturing and test systems and
for instrument stacks in benchtop use.

The low weight of the product makes it ideal for portable applications within maintenance environments.

**Spectral Purity**

Measurement of receiver selectivity and ultimate signal to noise ratio requires good spectral purity. The 2023A/B and 2025 have a low residual FM of typically 3 Hz and a commendable sideband noise of typically -121 dBc/Hz at 1 GHz, (20 kHz offset) to allow demanding measurements to be made at an affordable cost. Good close in phase noise is also achieved with results at 100 Hz offsets typically <-85 dBc.

**Modulation**

Comprehensive amplitude, frequency, phase, FSK and pulse modulation facilities are provided for testing all types of receivers. A MOD ON/OFF key simplifies the testing of signal to noise ratio.

**Amplitude and Pulse Modulation**

Amplitude modulation with a 1 dB bandwidth of 30 kHz and modulation depths of up to 99.9% with a resolution of 0.1% ensures the generator is suitable for testing AM systems and undertaking EMC immunity measurements. The standard pulse modulation facility has an on/off ratio of better than 40 dB and a rise/fall time of less than 10 µs enabling characterization of TDMA or TDD bursts in RF amplifiers and modules. The internal square wave modulation source may be used to self pulse modulate the generator for use in EMI applications.

An optional Fast Pulse modulator improves the on/off ratio to typically >80 dB with rise and fall times of <20 ns.

**Frequency and Phase Modulation**

With a 1 dB FM bandwidth of 275 kHz and a deviation range of 0 to 12.8 MHz, the 2023A/B and 2025 signal generators offer a wide range frequency modulation capability. AC or DC coupled FM can be selected with very low carrier frequency error and drift in the AC coupled mode ideal for testing TDMA or TDD bursts in RF amplifiers and modules. The required FM deviation is set from the front panel.

**FSK**

The generation of 2 level and 4 level FSK signals is possible directly from external logic inputs. The TTL data is automatically filtered using a 8th Order 3.9 kHz Bessel filter to reduce spectral spreading, as required by both ERMES and FLEX™ paging systems. The required FM deviation is set from the front panel.

**Modulation Oscillator**

An internal modulation oscillator is provided which is capable of generating one or two tones in the frequency range of 0.01 Hz to 20 kHz. In addition to a sine wave output, a triangular or square wave is provided. Internal and external modulation sources may be combined to produce more complex modulation types.

**Sweep**

The sweep facility of the 2023A/B and 2025 offers linear and logarithmic sweeps. The user can program all sweep parameters including start and stop frequency, size of step, time per step and a percentage increment in the case of logarithmic sweep.

The sweep can be paused and the frequency varied by the rotary control to investigate a problem area.

The sweep can be initiated from the keyboard or by an external trigger input and can be set to single, continuous, stepped or start/stop operation.

The frequency sweep facility is particularly well suited to EMI testing. During a frequency sweep, the RF level can be altered using the rotary control to manually correct the level at the output of amplifiers. The square wave modulation source allows the generation of square waves at frequencies up to 10 kHz.
wave amplitude modulation to simulate the effect of TDMA bursts from communication systems on devices being tested for EMI.

The optional high RF output power to +25 dBm can eliminate the need for external amplifiers when using small test cells.

**Instrument Stores**

The 2023A/B and 2025 signal generators provide extensive storage facilities for simplifying repetitive tests. Up to 100 carrier frequency values and 100 complete instrument settings can be saved to non-volatile stores. Storage is achieved without the need for batteries and so avoids problems of periodic replacement.

A software protection system ensures that individual stored settings cannot be accidentally overwritten.

A further 100 volatile stores are available for complete instrument settings. Their contents can be downloaded over GPIB and then recalled by store number to reduce the time overhead introduced by the handling of the GPIB protocol.

**Sequencing**

A software facility allows 9 sequences of stored instrument settings to be defined. The incrementing facilities can then be used to cycle through the settings in manually operated test systems or be operated via an external trigger.

**Calibration Data**

All alignment data, including the internal frequency standard adjustment, is digitally derived and realignment can be undertaken without removal of external covers, by protected front panel functions or via the GPIB. Use of digitally stored realignment eliminates the use of mechanical adjusters to minimize long term drift and vulnerability to mechanical shock.

Status information is stored, including an identity string (type and serial number), choice of internal or external standard and GPIB address.

An elapsed time facility allows the monitoring of the number of hours the product has been in use. A recommended calibration interval of 2 years helps towards low cost of ownership.

**Programming**

A GPIB interface is fitted as standard with all functions controllable over the bus. The protocol and syntax of GPIB commands are designed in accordance with IEEE 488.2 standard to simplify the generation of ATE programs.

In talk mode, the current settings, instrument status and the identity string can be read.

A RS-232 interface is fitted as standard with a common command set to GPIB commands. RS-232 control is particularly suitable for use with simple external controllers or RF modems when the instrument is being used in a remote location.

**Memory Cloning**

The stored settings in one signal generator can be transferred to others without the use of an external controller using the direct interconnection of GPIB or RS-232 interfaces. This facility is particularly useful for duplicating test set ups on manual production lines.

**OPTIONS**

The standard features of the signal generator can be enhanced by taking advantage of the various options available.

**Option 1 - No Attenuator**

This option reduces the instrument cost by deleting the internal attenuator. An RF output range from -2 dBm to +15 dBm is provided and is a very economic solution for applications requiring a local oscillator.

**Option 2 - DC Operation**

The DC supply option allows the signal generator to be used in vehicles, remote areas or where the integrity of the AC supply is not guaranteed.

**Option 3 - High Power**

A high power option is available which extends the RF output up to +25 dBm ideal for use as a local oscillator or for testing passive and active components.

**Option 4 - High Stability Frequency Standard**

An OCXO internal reference can replace the standard TCXO where improved frequency stability is required.

**Option 5 - Rear Panel Connectors**

All front panel connectors may be removed and fitted to the rear panel for use in production racks.

**Option 7 and 11 - Fast Pulse Modulator**

A pulse modulator suitable for generating fast pulses with high isolation for applications in radar and EMI.

**Option 12 - SINAD Measurement**

A fully independent high performance SINAD meter with selectable weighting filters can be fitted for receiver sensitivity measurements.

**SPECIFICATION**

**GENERAL DESCRIPTION**

The 2023A/B and 2025 cover the frequency range 9 kHz to 1.2 GHz, 2.05 GHz and 2.51 GHz respectively.

The RF output can be amplitude, frequency, phase or pulse modulated. An internal synthesized programmable AF source is capable of generating single or simultaneous two tone modulation.

GPIB and RS-232 are included as standard to enable remote control of all functions except the supply switch.

**CARRIER FREQUENCY**

**Range**

- 9 kHz to 1.2 GHz (2023A)
- 9 kHz to 2.05 GHz (2023B)
- 9 kHz to 2.51 GHz (2025)

**Resolution**

- 1 Hz

**Accuracy**

As frequency standard
Phase incrementing

The carrier phase can be advanced or retarded in steps as low as 0.09° using the rotary control.

RF OUTPUT

Range
-140 dBm to +13 dBm, 0.1 dB resolution. When AM is selected, the maximum RF output level decreases linearly with increasing AM depth to +7 dBm at 99.9% depth.

RF Level Units
Units may be set to $\mu$V, mV, EMF or PD; dB relative to 1 $\mu$V, 1 mV EMF or PD; or dBm. Conversion between dB and linear units may be achieved by pressing the appropriate units key (dB or V, $\mu$V, mV). The output level can be normalized for 75 $\Omega$ operation with an impedance converter.

Level Accuracy\(^1\)

</tbody>
</table>

\(^1\) Over range +17°C to +27°C

Attenuator Hold
Selection of Attenuator hold provides for uncalibrated level reduction of at least 10 dB without the Mechanical Attenuator operating.

VSWR
For output levels less than -5 dBm, output VSWR is less than 1.3:1 for carrier frequencies up to 1.2 GHz and less than 1.5:1 for carrier frequencies up to 2.51 GHz.
For output levels greater than -5 dBm output VSWR is less than 1.5:1 for all carrier frequencies.

RF Output Connector
50 $\Omega$ type N connector to MIL-PRF-39012

Output Protection
Protected from a source of reverse power up to 50 W from 50 $\Omega$ or 25 W from a source VSWR of 5:1. Protection circuit can be reset from the front panel or via the GPIB/RS-232 interfaces.

SPECTRAL PURITY

At RF levels up to +7 dBm:

Harmonics
Typically better than -30 dBc for RF levels up to +7 dBm.
Typically better than -25 dBc for RF levels up to +13 dBm.

Non-Harmonics (for offsets >3 kHz)
Better than -70 dBc to 1 GHz, better than -64 dBc between 1 and 2.05 GHz better than -60 dBc above 2.05 GHz.

Residual FM (FM off)
Less than 4.5 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 1 GHz.

SSB Phase Noise
Better than -124 dBc/Hz at 20 kHz offset from a carrier frequency of 470 MHz, typically -121 dBc/Hz at 20 kHz offset from a carrier frequency of 1 GHz.

Carrier leakage
Less than 0.5 $\mu$V PD at the carrier frequency in a two turn 25 mm diameter loop, 25 mm from the surface of the signal generator.

DM on AM
Typically 0.1 radians at 30% depth at 470 MHz.

MODULATION MODES

Internal and external modulation can be simultaneously enabled to allow combined amplitude and frequency (or phase) modulation.
Pulse modulation can be used in combination with the other forms of modulation from an external pulse source.

Accuracy at 1 kHz
±4%

Bandwidth (1 dB)
DC to 275 kHz (DC coupled)
10 Hz to 275 kHz (AC coupled)
20 Hz to 275 kHz (AC coupled with ALC)

Group delay
Less than 5 $\mu$s to 100 kHz

Carrier frequency offset (DC coupled)
Less than 1% of the set frequency deviation

Distortion
<1% at 1 kHz rate for deviations up to 20% of max available deviation, typically 0.1% for deviations of 2% of max available deviation and <3% at max available deviation

Modulation source
Internal LF generator or external via front panel BNC

FSK

Modes
2 level or 4 level FSK

Data source
External data connected to TRIGGER connector (2 level) or TRIGGER and PULSE connectors (4 level)

Note with option 7 fitted, rear panel PULSE input is labelled FSK2
Frequency shift
Settable up to ±100 kHz

Accuracy
As FM deviation accuracy

Timing jitter
±3.2 µs

Filter
8th order Bessel, -3 dB at 3.9 kHz

PHASE MODULATION

Deviation
0 to 10 radians, 3 digits or 0.01 resolution

Accuracy at 1 kHz
±4% of indicated deviation excluding residual phase modulation

3 dB bandwidth
100 Hz to 10 kHz

Distortion
Less than 3% at 10 radians at 1 kHz modulation rate. Typically <0.5% for deviations up to 1 radian at 1 kHz

Modulation source
Internal LF generator or external via front panel BNC

AMPLITUDE MODULATION
FOR CARRIER FREQUENCIES 2 GHz

Range
0 to 99.9%, 0.1% resolution

Accuracy
±5% of set depth at 1 kHz (at +17°C to 27°C ambient temperature), temperature coefficient < ±0.02%/°C

1 dB bandwidth
DC to 30 kHz (DC coupled)
10 Hz to 30 kHz (AC coupled)
20 Hz to 30 kHz (AC coupled with ALC)

Distortion
<2.5%* at 1 kHz rate for modulation depths up to 80% and <1.5% at 1 kHz rate for modulation depths up to 30%
*<3.5% for carrier freqs above 500 MHz

Modulation source
Internal LF generator or external via front panel BNC

PULSE MODULATION
FOR FAST PULSE MODULATOR SEE OPTIONS

Frequency range
32 MHz to 2.51 GHz, useable to 10 MHz

RF output range
Maximum guaranteed output is reduced to +8 dBm
(+20 dBm or +14 dBm with high power option when pulse modulation is selected)

RF level accuracy
When pulse modulation is enabled, adds ±0.5 dB to the RF level accuracy specification

On/off ratio
Better than 45 dB below 1.2 GHz, better than 40 dB above 1.2 GHz

Rise and fall times
Less than 10 µs

Control
Pulse input is on a rear panel BNC with 10 kΩ nominal input impedance. A HCT logic 0 (0 V to 0.8 V) turns the carrier off, a HCT logic 1 (2.0 V to 5 V) turns the carrier on. Max safe input is ±15 V

INTERNAL LF GENERATOR

Frequency range
0.01 Hz to 20 kHz

Resolution
5 digit

Frequency accuracy
As frequency standard

Distortion
Less than 0.1% THD at 1 kHz

Waveforms
Sine wave to 20 kHz and a triangular or square wave to 3 kHz

Square wave jitter
<6.4 µs on any edge

Audio output
The modulation oscillator signal is available on a front panel BNC connector at a level of 2 V RMS EMF from a 600 Ω source impedance.

EXTERNAL MODULATION

Input on the front panel via BNC connector. 1 V RMS (1.414 V pk) sine wave for set deviation. Input sensitivity may be optionally specified for 1 V pk (option 10). Input impedance is 100 kΩ nominal.

MODULATION ALC

The external modulation input can be levelled by a peak levelling ALC system over the input voltage range of 0.5 V to 1.25 V RMS sine wave.

High and low indicators on the display indicate when the input is outside the levelling range.

SWEEP MODE

Control parameters
Start and stop values of carrier frequency

Linear sweep
Frequency step size of 1 Hz minimum

Logarithmic sweep
Percentage increment of 0.01% to 50% in 0.01% steps

Step time
50 ms to 10 s per step
Trigger
A trigger input is available on a rear panel BNC connector and can be used for single, continuous, start/stop or single step mode.

FREQUENCY STANDARD

TCXO
10 MHz

Temperature Stability
Better than ±7 in 10⁷ over the operating range of 0 to 55°C

Ageing rate
Less than ±1 in 10⁶ per year

External input
Rear panel BNC connector accepts an external input of 1 MHz or 10 MHz at a level of 220 mV RMS to 1.8 V RMS into 1 kΩ

Output
Rear panel BNC connector provides an output of 10 MHz at a nominal level of 2 V pk-pk into 50 Ω

GENERAL

REMOTE CONTROL

GPIB
All functions except the supply switch are remotely programmable

Capabilities
Designed in accordance with IEEE 488.2.
The GPIB interface complies with the following subsets as defined in IEEE standard 488.1:
SH1, AH1, T6, TE, L4, LE, SR1, RL1, PP0, DC1, DT1, CO, E2

RS-232
All functions except the supply switch are remotely programmable

Connector
9 way male D-type

Bit rate
300 to 9600 bits/s

Handshake
Hardware: DTR, RTS, CTS and DSR
Software: XON and XOFF

Electrical
Interface to EIA-232-D

ELECTROMAGNETIC COMPATIBILITY
Conforms with the protection requirements of the EEC Council Directive 89/336/EEC. Conforms with the limits specified in the following standards:
IEC/EN61326-1 : 1997, RF Emission Class B, Immunity Table 1, Performance Criteria B

SAFETY
Conforms with the requirements of EEC Council Directive 73/72/EEC (as amended) and the product safety standard IEC/EN 61010-1 : 2001 + C1 : 2002 + C2 : 2003 for class 1 (or 3) portable equipment, for use in a Pollution Degree 2 environment. The instrument is designed to be operated from an Installation Category 2 or 1 + 2 supply.

RATED RANGE OF USE (Over which full specification is met)
Temperature
0 to 55°C
Humidity
Up to 93% at 40°C
Altitude
Up to 3050 m (10,000 ft)

CONDITIONS OF STORAGE AND TRANSPORT
Temperature
-40°C to +71°C
Humidity
Up to 95% at 40°C
Altitude
Up to 4600 m (15,000 ft)

POWER REQUIREMENTS

AC Supply
100 to 120 V~, 50 - 400 Hz (Limit 90 - 132 V~, 45 - 440 Hz)
210 - 240 V~, 50 - 60 Hz (Limit 188 - 264 V~, 45 - 66 Hz)
200 VA maximum

CALIBRATION INTERVAL
2 years

DIMENSIONS AND WEIGHT
(over projections but excluding front panel handles)
Height Width Depth Weight
107 mm 419 mm 440 mm <8 kg

OPTIONS

OPTION 1 - NO ATTENUATOR
(cannot be specified with option 7 or option 3)
Omits the internal step attenuator. Specification as standard instrument with following exceptions:

RF output range
From -2 dBm to +15 dBm. When AM is selected the maximum output level reduces linearly with AM depth to +9 dBm at maximum AM depth.

Pulse modulation
Not available with option 1

Output protection
Reverse power protection is not provided

OPTION 2 - DC OPERATION
Allows for operation from an external DC power source in addition to an AC power source. Specification as standard instrument with the following additions:

DC supply range
11 V to 32 V

AC Supply
100 to 120 V~, 50 - 400 Hz
For the very latest specifications visit www.aeroflex.com

(DC consumption
70 W with option 3 not fitted. 95 W with option 3 and 4 fitted.

Rated Range of Use
Temperature
0 to 45°C

OPTION 3 - HIGH POWER
If fast pulse modulation is needed see Option 11
Specifications as standard instrument with the following exceptions:

RF output range
-140 dBm to +25 dBm (Output power is uncalibrated above
+19 dBm for carrier frequencies above 1.2 GHz and above
+14 dBm above 2.4 GHz). Maximum output is reduced by 5 dB
when standard pulse modulation is selected and/or by up to 6 dB
dependent upon set AM depth.

Harmonics
Typically better than -25 dBc for levels 6 dB below the maximum specified output.

Amplitude Modulation (for RF levels from +7 dBm to +18 dBm)
Carrier frequency <500 MHz
Standard depth and distortion spec applies
Carrier frequency 500 MHz to 2 GHz
Accuracy (from +17°C to +27°C ambient, temperature coefficient
<±0.02%/°C)
±7.5% of set depth at 1 kHz mod rate
Distortion (at 1 kHz mod rate)
<5% up to 80% depth
<2.5% up to 30% depth

OPTION 4 - HIGH STABILITY FREQUENCY STANDARD
Replaces the internal TCXO with a high stability OCXO. Specification as standard instrument with the following exceptions:

Aging rate
±2.5 in 10⁷ per year, ±5 in 10⁹ per day after 2 months continuous use

Stability
Better than ±5 in 10⁸ over the temperature range 0 to 50°C

Warm up time
Within 2 in 10⁷ of final frequency 10 minutes after switch on at a temperature of 20°C

Signal Sources

2026A/B 10 kHz to 2.05/2.51 GHz MultiSource Generator

Up to three fully functional signal generators in one unit offering a unique solution for complex tests on receivers, components and systems.

- Two or three high quality RF signal generators in a space efficient format
- Ideal for intermodulation and receiver characterization
- Wide frequency coverage:
  - 10 kHz to 2.05 GHz (2026A)
  - 10 kHz to 2.51 GHz (2026B)
- +24 dBm RF output for effective component testing
- Support for an external signal generator
- Application specific test modes simplify measurement procedures
- User defined tracking between signal sources
- Adjustable carrier phase to allow peaking of three tone intermodulation
- Built-in switched combiner network improves measurement uncertainty
- Optional GSM modulation for testing multi-carrier power amplifiers
- Optional Bluetooth and GSM modulation

The 2026A/B are multiple source generators which offer two RF signal generators in one box with a third source available as an option. Each source is a fully functional RF signal generator with AM, FM, ØM, 2FSK, 4FSK and pulse modulation capability.

The 2026A/B are ideal for use in R&D and manufacturing where there is a need for two or three combined sources for conducting tests such as intermodulation and selectivity performance of components and receiver assemblies.

To aid the user to undertake difficult test procedures simply and without ambiguity, the 2026A/B family provide application-specific modes of operation. Application modes include amplifier two and three-tone intermodulation, receiver intermodulation and receiver selectivity. A rotary control and up/down keys allow easy modification of the selected parameters.

Measurement Accuracy

The use of a built in combiner, switches and cables eliminates many of the measurement uncertainties introduced by connecting together separate signal generators. The 2026A/B family thereby guarantees the level of intermodulation products introduced during amplifier or receiver intermodulation testing.

All alignment processes, including the internal frequency standard and the correction factors for the signal source RF paths, are digitally derived so realignment can be undertaken without removal of external covers. Digital adjustment also eliminates the use of mechanical adjusters, minimizing long term drift and vulnerability to mechanical shock.

Application Modes

The 2026A/B family has a Set Up Key to enable the applications to be selected. Each Set Up is displayed as a pictorial representation of the internal signal source routing. A spectral diagram is used to show the parameters to be entered in each application in well known engineering terminology.
Spectral diagram of two tone intermodulation on a receiver

For example, selecting ‘Intermodulation on a Receiver Test’ allows the signal sources to be automatically set by entering the receiver input frequency and level, the ratio of the level of the two interferers (relative to the receiver input level) and the offset frequency (channel spacing).

Application mode for intermodulation test on a receiver

Other application modes include 2 and 3 tone intermodulation tests on amplifiers and receiver selectivity.

Flexible Source Routing

Each of the signal sources can either be routed to a separate output connector or switched to the input of an RF combiner network before being fed to the combiner output connector. The combiner routing is set up quickly and effectively using the Combiner Set Up menu. The flexibility of the signal routing allows the 2026A/B family to accept an external signal generator, such as the 2050 Digital and Vector Generator, to enable different forms of carrier signals to be produced. Alternatively the output from a 2029 Vector Modulator, driven from one of the 2026A/B sources can be routed in.

Setting up the source and combiner routing

Automatic Source Coupling

As an alternative to the application modes, the 2026A/B MultiSource Generator family allows the frequency and level of the internal RF sources to be coupled together with a user defined offset. The source frequencies can have an offset with an additional harmonic (or sub-harmonic) relationship to simplify the testing of harmonic converters and divider systems.

The coupling factors are entered by an easily understood format using a dedicated coupling menu.

Setting up coupling

The ability to set sources to track each other greatly simplifies the testing of mixers, multipliers and dividers by reducing the number of active controls required.

Sweep

The 2026A/B family allows one of the RF sources to be frequency swept with user defined start, stop, and step values to reduce the amount of operator time or GPIB overhead. By enabling the coupling facility, sweeping one source will simultaneously sweep the other internal RF sources to allow automated swept measurements on frequency conversion devices to be made.

The sweep can be performed with modulation enabled for swept measurements of receiver immunity characteristics.

High RF Output

The high RF level of the individual outputs is ideal for testing components and ensures that the 2026A/B family can generate high RF levels at the combiner output while maintaining low levels of inter-modulation.

Comprehensive Modulation

Each signal source is capable of being independently modulated from its own fully programmable modulation source to ensure maximum flexibility. The internal modulation sources are each capable of generating sine, triangle or square wave signals.

Amplitude, frequency and phase modulated carriers can be generated from the internal modulation sources or from the independent external inputs. The frequency modulation system provides excellent performance in the DC coupled mode with very low carrier frequency error and stability ensuring that the generator can accurately test
receivers sensitive to small frequency errors.

**Pulse Modulation**

Each source is capable of being independently pulse modulated to allow the simulation of TDD or TDMA RF signal bursts with pulse on/off ratios of better than 40 dB and a rise time of less than 10 µs.

**FSK**

In addition to the analog FM facilities, the 2026A/B MultiSource Generator family supports 2 and 4-level FSK signals from external logic inputs. The FM deviation generated is set by keyboard entry of the required deviation. The facility is ideal for testing paging receivers and RF modems.

**GSM Modulation**

Option 116 is available to allow 2026A/B to emulate GSM signals using FM techniques which achieve superior noise floor performance than solutions using IQ systems. The facility is ideal for testing GSM receiver selectivity and for testing the linearity of high performance multi-carrier power amplifiers.

**High Spectral Purity**

Measurement of receiver selectivity and ultimate signal-to-noise ratio requires good spectral purity. The 2026A/B family has a low residual FM of typically 3 Hz and typical sideband noise of -121 dBc/Hz at 20 kHz offset from 1 GHz, to allow demanding measurements to be made.

**Programming**

A GPIB interface is fitted so that all standard signal generator functions are controllable over the bus. The protocol and syntax of GPIB commands has been designed in accordance with IEEE 488.2 standard to facilitate the generation of ATE programs.

**Low Cost of Ownership**

An electronic trip protects the individual source outputs against the accidental application of reverse power.

Careful attention to the thermal design and the use of well-proven signal generator modules gives high reliability and calibration validity.

The use of flash memory and software download via the RS-232 interface means the 2026A/B family can be upgraded with its covers fitted.

**Options**

**Option 001 - Third Source**

The 2026A/B family as standard is supplied with two RF sources. A version with 3 sources is available as an option to support applications such as intermodulation tests on a receiver.

**Option 003 - High Stability Time Base**

For applications requiring improved frequency stability and close-in phase noise, the standard TCXO can be replaced by a high performance OCXO.

**Option 004 - Rear Panel Connections**

The RF connectors for all sources, their associated modulation and pulse inputs and the combiner output connector can be mounted on the rear panel for ease of use within an ATE environment, as a factory option.

**Option 116 - GSM PRBS Modulation**

This option gives the 2026A/B family the capability for each source to emulate a GSM carrier. This makes the 2026A/B suitable for performing test on GSM multicarrier amplifiers and GSM receivers.

**Option 117 - Bluetooth and GSM PRBS Modulation**

This option provides modulation facilities for two Bluetooth modulated carriers and a carrier emulating GSM Modulation.

**Specification**

**General Description**

The 2026A/B MultiSource Generator family contains synthesized signal generators offering up to three independent RF sources with separate outputs or one or more of the signals routed via a combiner. The 2026B Signal Generator covers the range 10 kHz to 2.51 GHz. 2026A Signal Generators are limited to 2.05 GHz. An external signal generator can be fed into the standard 2-source 2026A or 2026B. Each signal source can be controlled independently in frequency and level and each has its own amplitude, frequency and pulse modulation capability. All parameters can be entered from the front panel keyboard and a rotary control can be used to adjust most settings. The following signal generator specifications apply to all of the sources fitted.

**Carrier Frequency**

**Range**

10 kHz to 2.05 GHz with a resolution of 1 Hz (2026A)
10 kHz to 2.51 GHz with a resolution of 1 Hz (2026B)

**Accuracy**

As frequency standard
**RF OUTPUT**

**Output Range**

<table>
<thead>
<tr>

<td>-140 to +6 dBm</td>
</tr>
</tbody>
</table>

Maximum output is further reduced by 5 dB when Pulse modulation is selected and/or by up to 6 dB when AM is selected dependant upon AM depth.

**Resolution**

0.1 dB

**RF Level Units**

Units may be set to µV, mV, EMF or PD; dB relative to 1 µV, 1 mV, EMF or PD; or dBm. Conversion between dB and linear units may be achieved by pressing the appropriate units key (dB or V, mV, µV). The output level can be normalized for 75 Ω operation with an optional external impedance converter (applies to all outputs simultaneously).

**RF Output Accuracy (over temp. range 17 to 27°C)**

</tbody>
</table>

**Attenuator hold**

Inhibits operation of the step attenuator from the level at which the key is enabled. Useable for a level reduction of at least 10 dB. Typical accuracy ±3 dB.

**VSWR**

Individual outputs

For output levels less than -5 dBm, output VSWR is less than 1.5:1 for carrier frequencies up to 1.2 GHz and less than 1.7:1 for carrier frequencies up to 2.51 GHz (2.05 GHz for 2026A).

Combined output

Output VSWR is less than 1.22:1 for carrier frequencies between 1 MHz to 1.2 GHz and less than 1.32:1 for carrier frequencies up to 2.51 GHz (2.05 GHz for 2026A).

**RF Output connector**

50 Ω type N connector to MIL-PRF-39102.

**Output protection**

Individual outputs

Protected from a source of reverse power up to 25 W from a source VSWR of 5:1. Protection circuit can be reset from the front panel or via the GPIB or RS-232 interface.

Combined output

No reverse power protection. Maximum total safe power 0.5 W.

**SPECTRAL PURITY**

**Harmonics (above 1 MHz)**

Individual outputs:

Typically better than -30 dBc for RF level up to +6 dBm, typically better than -25 dBc for RF levels up to +18 dBm (+14 dBm above 1.2 GHz).

Combined output:

Typically better than -30 dBc for RF level up to -18 dBm, typically better than -25 dBc for RF levels up to +4 dBm. (0 dBm above 1.2 GHz).

**Non-Harmonics (for offsets >3 kHz)**

Better than -70 dBc to 1 GHz, better than -64 dBc above 1 GHz, better than -60 dBc above 2 GHz.

**Isolation**

Better than 80 dB between individual outputs in use

Better than 60 dB from a used individual output and the combiner output

Better than 40 dB between the combiner output and an unused individual output

**Intermodulation**

At an RF output level of 0 dBm on the combiner into a load VSWR of 2.1 or better.

**Frequency Range Two Tone Intermodulation** |1|

* Third order intermodulation products. Intermodulation levels reduce with reducing RF Level.

**Residual FM (FM off)**

Less than 4.5 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 1 GHz.
Typically <1 Hz at 249 MHz, <2 Hz at 501 MHz <3 Hz at 1001 MHz <6 Hz at 2001 MHz.

SSB phase noise
Better than -124 dBc/Hz at 20 kHz offset from a carrier frequency of 470 MHz, typically -121 dBc/Hz at 20 kHz offset from a carrier frequency of 1 GHz.

Carrier Leakage
Less than 0.5 µV PD at the carrier frequency in a two turn 25 mm diameter loop, 25 mm from the surface of the signal generator.

MODULATION CAPABILITY

FM, AM or phase modulation can be applied to the carriers generated by each signal source from independent internal or external modulation sources. The internal modulation sources are capable of generating two simultaneous signals into any one of the modulation channels. Each internal and external modulation source can be simultaneously enabled to produce combined amplitude and frequency (or phase) modulation. Pulse modulation can be applied to each of the carriers from external pulse sources. The pulse modulation can be used in combination with the other forms of modulation. 2 level or 4 level FSK modulation can be applied to each carrier using data from an external source.

Accuracy at 1 kHz
±5%

Bandwidth (1 dB)
DC to 275 kHz (DC coupled)
10 Hz to 275 kHz (AC coupled)
20 Hz to 275 kHz (AC coupled with ALC)

Group delay
Less then 5 µs to 100 kHz

Carrier frequency offset (DC coupled)
Less than 1% of the set frequency deviation

Distortion
<1% at 1 kHz rate for deviations up to 20% of max available deviation, typically 0.1% for deviations of 2% of max available deviation and <3% at max available deviation

Modulation source
Internal modulation oscillator or external via front panel BNC

FSK

Modes
2 level or 4 level FSK, external data input via a 25 way rear panel D Type connector

Frequency shift
Variable up to ±100 kHz

Accuracy
As FM deviation accuracy, timing jitter ±3.2 µs

Filter
8th order Bessel BW 3.9 kHz

PHASE MODULATION

Deviation
0 to 10 radians, resolution 3 digits or 0.01 radians

Accuracy at 1 kHz
±5% of indicated deviation excluding residual phase modulation

3 dB Bandwidth
100 Hz to 10 kHz

Distortion
Less than 3% at 10 radians at 1 kHz modulation rate. Typically <0.5% for deviations up to 1 radian at 1 kHz

Modulation source
Internal LF generator or external via front panel BNC.

AMPLITUDE MODULATION

Individual Outputs
For carrier frequencies <500 MHz useable to 1.5 GHz

Combined Output
Unspecified below 5 MHz useable to 1 MHz, otherwise as individual outputs.

Range
0 to 99.9%, resolution 0.1%

Accuracy\(^2\)
±5% of set depth at 1 kHz, over temperature range 17°C to 27°C
Temperature coefficient < 0.02%/°C

1 dB Bandwidth
DC to 30 kHz (DC coupled)
10 Hz to 30 kHz (AC coupled)
20 Hz to 30 kHz (AC coupled with ALC)

Distortion\(^2\)
<1.5% at 1 kHz rate for modulation depths up to 30%
<2.5% at 1 kHz rate for modulation depths up to 80%

Modulation source
Internal LF generator or external, via front panel BNC

PM on AM
Typically 0.1 radians at 30% depth at 470 MHz
PULSE MODULATION

Frequency range
32 MHz to 2.51 GHz (2.05 GHz for 2026A), usable to 10 MHz

RF level range
Maximum guaranteed output is reduced by 5 dB when pulse modulation is selected

RF level accuracy
When pulse modulation is enabled, adds ±0.5 dB to the RF level accuracy specification

Control
Pulse input is on a front panel BNC with 10 kΩ nominal input impedance. A logic 0 (0 V to 1 V) turns the carrier off, a logic 1 (3.5 V to 5 V) turns the carrier on. Maximum input is ±15 V

On/off ratio
Better than 45 dB below 1.2 GHz, better than 40 dB above 1.2 GHz

Rise and fall times
Less than 10 µs, overshoot <1 dB

MODULATION OSCILLATOR

The internal modulation oscillator for each signal source is capable of generating one or two modulation tones simultaneously in one modulation channel.

Frequency range
0.01 Hz to 20 kHz with a resolution of 0.01 Hz, frequency accuracy as frequency standard

Distortion
Less than 0.1% THD at 1 kHz

Waveforms
Sine wave to 20 kHz and a triangular or square wave to 3 kHz

Square wave jitter
<6.4 µs on any edge

Audio Output
The modulation oscillator signal from each source is available on the front panel Modulation Input/Output BNC connector at a nominal level of 2 V RMS EMF from a 600 Ω source impedance.

EXTERNAL MODULATION

Input on the front panel Modulation Input/Output connector. The modulation is calibrated with 1.414 V peak (1 V RMS sine wave) applied. Input impedance is 100 kΩ nominal. Maximum safe input ±15 V.

MODULATION ALC

The external modulation input can be levelled by a peak levelling ALC system over the input voltage range of 0.75 V to 1.25 V RMS sine wave. High and low indicators in the display indicate when the input is outside levelling range.

SWEEP MODE

The carrier frequency of one source can be swept. To enable more than one source to be swept the coupling facility must be invoked.

The start/stop values of carrier frequency, frequency step size and time per step can be set.

Step time
50 ms to 10 s per step

Trigger
A trigger input is available on a rear panel BNC connector and can be used in single, continuous, start/stop or single step mode.

FREQUENCY STANDARD

FREQUENCY STANDARD (TCXO)

Frequency 10 MHz

Temperature Stability
Better than ±7 in 10° over the operating range of 0 to 55°C

Aging rate
Less than ±1 in 10° per year

External input/output
Rear panel BNC connector accepts an external input of 1 MHz or 10 MHz at a level of 220 mV RMS to 1.8 V RMS into 1 kΩ. Rear panel BNC connector provides an output of 10 MHz at a nominal level of 2 V pk-pk into 50 Ω.

GENERAL

GPB INTERFACE

All signal source parameters except the supply switch are remotely programmable.

Designed in accordance with IEEE 488.2.

RS-232

All signal source parameters except the supply switch are remotely programmable.

Connector is 9 way D type, baud rate 300 to 9600 bits per second.

Handshake hardware is DTR, RTS, CTS and DSR and software is XON and XOFF. Electrical interface is to EIA-232-D.

ELECTROMAGNETIC COMPATIBILITY

Conforms with the protection requirements of Council Directive 89/336/EEC. Complies with the limits specified in the following standards:

IEC/EN61326-1 : 1997, RF Emission Class B, Immunity Table 1, Performance Criteria B

SAFETY

Conforms with the requirements of EEC Council Directive 73/72/EEC (as amended) and the product safety standard IEC/EN 61010-1 : 2001 + C1 : 2002 + C2 : 2003 for class 1 portable equipment, for use in a Pollution Degree 2 environment. The instrument is designed to be operated from an installation category 2 supply.

RATED RANGE OF USE

(Over which full specification is met unless otherwise indicated.)

Temperature 0 to 55°C, Humidity up to 93% at 40°C

Altitude up to 3050 m (10,000 ft)
CONDITIONS OF STORAGE AND TRANSPORT
Temperature -40 to +71°C, Humidity up to 93% at 40°C
Altitude up to 4600 m (15,000 ft)

POWER REQUIREMENTS
AC SUPPLY
Voltage
100 - 240 V ~(Limit 90 - 264 V~)
Frequency
50 - 60 Hz (Limit 45 - 66 Hz)
Power Consumption
250 VA maximum

CALIBRATION INTERVAL
2 years

DIMENSIONS AND WEIGHT
(over projections but excluding front panel handles)
Height 177 mm
Width 419 mm
Depth 488 mm
Weight 16 kg

OPTIONS
OPTION 001 - 3 SOURCE SIGNAL GENERATOR
Includes 3 signal sources

OPTION 003 - HIGH STABILITY FREQUENCY STANDARD
Replaces the internal TCXO with a high stability OCXO. Specification as standard instrument with the following exceptions:
Ageing rate
±2.5 in 10° per year, <±5 in 10° per day after two months continuous use
Stability
Better than ±5 in 10° over the temperature range 0 to 50°C
Warm up time
Within 2 in 10° of final frequency 10 minutes after switch on at a temperature of 20°C

OPTION 004 - REAR PANEL INPUTS
RF output, modulation input and LF output connectors are transferred to the rear panel. The signal generator specification is not altered.

OPTION 116 - GSM MODULATION
Option 116 is available on 2026Q and 2026A/B signal generators.
Baseband source
Data rate
270.833333 kHz (13 MHz/48).
Data rate accuracy
As 10 MHz frequency standard.
Filter
Gaussian filter approximated by eight-pole RC network.
Number of outputs
3
Data pattern
(2^12 -1) PRBS sequence.

SPECTRAL CHARACTERISTIC
Wideband noise
For an output of +10 dBm on the individual output typically -75 dBc measured in a 100 kHz bandwidth relative to the modulated signal measured in a 30 kHz bandwidth at 6 MHz offset, in accordance with ETSI-defined measurement methods on wideband noise.

Option 117 Bluetooth and GSM Modulation
Option 117 is available on the 2026A/B Signal Generators and provides a facility for generating two independent Bluetooth modulated carriers and a simulated GSM carrier. The modulation data source for each channel can be independently selected as either internal PRBS (Bluetooth PN 9, GSM Bluetooth PN 15) or external data. Refer to separate option 117 application note for further information.

Notes
(1) Does not apply to external RF input signals to combiner.
(2) For RF levels not exceeding +10 dBm (individual output) or -4 dBm (combined output).

Signal Sources

2026Q CDMA Interferer Multisource Generator

For the very latest specifications visit www.aeroflex.com

The 2026Q is designed to work with a radio test set to provide a fully integrated radio receiver test solution for cellular and PCS systems.

• Two tone interference generation for AMPS/CDMA receiver testing in accordance with IS-97-A/IS-98-A
• Option for providing GSM signals for receiver and amplifier testing
• Combiner output frequency range from 800 MHz to 2.0 GHz
• Provides single calibrated point of reference for the transceiver under test
• Excellent phase noise and spectral purity
• Elimination of additional RF combining or signal conditioning
• High internal isolation of returned signals
• Includes two independent, fully featured RF signal generators 10 kHz to 2.4 GHz
• Very low levels of internally generated intermodulation products
• Single unit solution for CDMA interference testing

Calibrated and Combined Signal Path
It is designed to produce a fully calibrated combined RF output containing any mix of internally generated interference signals from its two RF sources, together with a calibrated signal path for a radio test set transmit output. A return path from the transceiver back to the radio test set receiver input is also provided through the instrument as illustrated in figure 1.

This allows a CDMA receiver to be tested for sensitivity in the presence of single or dual tone interference. The interfering signals are combined without the need for any RF switching mechanism that would otherwise affect the test result.

Option 116 allows the 2026Q to provide GSM modulated signals for receiver or amplifier testing with low floor noise characteristics.

High Isolation
2026Q is configured to ensure high levels of isolation between each of the transmit and receive paths between the radio test set, the interfering signal sources and the transceiver under test.

The 2026Q is a derivative of the popular 2026 MultiSource RF signal generator. It has been designed to work directly with a CDMA radio test set to produce a fully integrated radio receiver test solution for CDMA cellular and PCS systems in accordance with IS-97-A/IS-98-A.

Figure 1 : 2026Q configured for radio testing with a test set
Path loss test data is supplied with each instrument for the frequency bands 865 MHz - 895 MHz, 1750 MHz - 1990 MHz. Drift influences within these bands is minimal ensuring a level accuracy of better than ±0.75 dB. The frequency response across each of these bands is flat to within ±0.1 dB, thus minimizing the need for additional system calibration.

Independent Signal Generators

Each of the RF generators contained within 2026Q may be used independently, routed to their individual RF connectors. In this mode, each generator covers the full frequency range 10 kHz to 2.4 GHz with an output power of between -137 dBm and +24 dBm. Each source may be independently modulated either from an internal or external source(s). Modulation modes include AM, FM, PM, Pulse and 2/4 level FSK. The standard 2026 specification applies when used in this mode.

Excellent Spectral Purity

Very low phase noise and spurious responses are achieved making them ideal for CDMA handset interference tests and other general purpose applications. The 2026Q has a low residual FM of typically 3 Hz and typical sideband noise of -121 dBc/Hz at 20 kHz offset from 1 GHz.

The excellent noise floor performance is more than adequate for mobile handset and base station testing.

Flexible Source Routing

Each of the signal sources can either be routed to a separate output connector or switched to the input of an RF combiner network before being fed to the combiner output connector. The combiner routing is set up quickly and effectively using the Combiner Set Up menu.

Sweep

The 2026Q allows either of the independent RF sources to be frequency swept with user defined start, stop, and step values to reduce the amount of operator time or GPIB overhead. By enabling the coupling facility, sweeping one source will simultaneously sweep the other internal RF source to allow automated swept measurements on frequency conversion devices to be made.

High RF Output

Each of the RF signal generators is able to deliver up to +24 dBm at their output, making them ideal for testing components such as mixers and amplifiers etc.

Comprehensive Modulation

Each signal source is capable of being independently modulated from its own fully programmable modulation source to ensure maximum flexibility. The internal modulation sources are each capable of generating sine, triangle or square wave signals.

Amplitude, frequency and phase modulated carriers can be generated from the internal modulation sources or from the independent external inputs.
The frequency modulation system provides excellent performance in the DC coupled mode with very low carrier frequency error and stability ensuring that the generator can accurately test receivers sensitive to small frequency errors.

Programming
A GPIB interface is fitted so that all standard signal generator functions are controllable over the bus. The protocol and syntax of GPIB commands has been designed in accordance with IEEE 488.2 standard to facilitate the generation of ATE programs.

A RS-232 interface is fitted as standard with a common command set to GPIB commands. RS-232 control is particularly suitable for use with simple external controllers or RF modems when the instrument is being used in a remote location.

Low Cost of Ownership
An electronic trip protects the individual source outputs against the accidental application of reverse power.

Careful attention to the thermal design and the use of well-proven signal generator modules gives high reliability and calibration validity.

The use of flash memory and software download via the RS-232 interface means the 2026Q can be upgraded with its covers fitted.

Option 116 - GSM Modulation
Option 116 is available to allow 2026A/B to emulate GSM signals using FM techniques which achieves superior noise floor performance than solutions using IQ systems. The facility is ideal for testing GSM receiver selectivity and for testing the linearity of high performance multi-carrier power amplifiers.

SPECIFICATION

GENERAL DESCRIPTION

The 2026Q CDMA Interferer MultiSource Generator is a purpose built instrument for testing CDMA hand-set and base station equipment. It features two synthesized RF signal generators with both independent and combined RF outputs. The combined RF output provides a path to and from the radio under test and an appropriate CDMA radio test set. Each signal source covers the frequency range 10 kHz to 2.4 GHz, whilst the combined path covers the range 800 MHz to 2.0 GHz.

CARRIER FREQUENCY

Independent source frequency range
10 kHz to 2.4 GHz with a resolution of 1 Hz

Combined output frequency range
800 MHz to 2.0 GHz with a resolution of 1 Hz

Accuracy
As frequency standard

RF OUTPUT

Range
Individual outputs
-137 dBm to +24 dBm

Combiner outputs
-137 dBm to -3 dBm

Maximum output is reduced by 5 dB when pulse modulation is selected and/or by up to 6 dB when AM is selected dependent upon AM depth.

Resolution
0.1 dB or 3 digits for linear units

Accuracy (Individual RF outputs)
(over temp range 17 to 27°C)

<table>
<thead>
<tr>
<th>RF Level</th>
<th>-127 dBm to -100 dBm</th>
<th>+6 dBm to +24 dBm</th>

</tr>
</tbody>
</table>

Attenuator hold
Inhibits operation of the step attenuator from the level at which the key is enabled. Useable for a level reduction of at least 10 dB. Typical accuracy ±3 dB.

VSWR

For output levels less than -5 dBm, output VSWR is less than 1.5:1 for carrier frequencies up to 1.2 GHz and less than 1.7:1 for carrier frequencies up to 2.4 GHz.

**RF Output connector**

50 Ω type N connector to MIL-PRF-39102.

**Output protection**

**Individual outputs**
Protected from a source of reverse power up to 50 W from 50 Ω or 25 W from a source VSWR of 5:1. Protection circuit can be reset from the front panel or via the GPIB interface.

**Combined output**
No reverse power protection.

**SPECTRAL PURITY**

**Harmonics**

Individual outputs:
Typically better than -30 dBc for RF levels up to +6 dBm, typically better than -25 dBc for RF levels up to +18 dBm (+14 dBm above 1.2 GHz).

Combined output:
Typically better than -30 dBc for RF levels up to +36 dBm, typically better than -25 dBc for RF levels up to +13 dBm.

**Non-Harmonics**

Better than -70 dBc to 1 GHz, better than -64 dBc above 1 GHz, better than -60 dBc above 2 GHz.

**Isolation**

Better than 80 dB between individual outputs in use. Better than 60 dB from a used individual output and the combiner output.

**Intermodulation**

<.80 dBc at an RF output level of -.22 dBm on the combiner, across the range 800 MHz to 2.0 GHz. Intermodulation levels reduce with reducing RF Level.

**Residual FM (FM off)**

Less than 4.5 Hz RMS deviation in a 300 Hz to 3.4 kHz un-weighted bandwidth at 1 GHz. Typically <1 Hz at 249 MHz, <3 Hz at 1001 MHz.

**Radio Connections**

Refer to Figure 1

**SSB phase noise**

Better than -124 dBc/Hz at 20 kHz offset from a carrier frequency of 470 MHz, typically -121 dBc/Hz at 20 kHz offset from a carrier frequency of 1 GHz.

**Carrier Leakage**

Less than 0.5 µV PD at the carrier frequency in a two turn 25 mm diameter loop, 25 mm from the surface of the signal generator.

**MODULATION CAPABILITY**

FM, AM or phase modulation can be applied to the carriers generated by each signal source from independent internal or external modulation sources.

The internal modulation sources are capable of generating two simultaneous signals into any one of the modulation channels. Each internal and external modulation source can be simultaneously enabled to produce combined amplitude and frequency (or phase) modulation.

Pulse modulation can be applied to each of the carriers from external pulse sources. The pulse modulation can be used in combination with the other forms of modulation.

2 level or 4 level FSK modulation can be applied to each carrier using data from an external source.

**FREQUENCY MODULATION**

**Deviation**

0 to 100 kHz

**Resolution**

3 digits or 1 Hz

**Accuracy at 1 kHz**

±5%

**Bandwidth (1 dB)**

DC to 100 kHz (DC coupled)
10 Hz to 100 kHz (AC coupled)
20 Hz to 100 kHz (AC coupled with ALC)

**Group delay**

Less than 5 µs to 100 kHz

**Carrier frequency offset (DC coupled)**

Less than 1% of the set frequency deviation

**Distortion**

Less than 1% at 1 kHz rate for deviations up to 100 kHz
Typically ≤0.3% at 1 kHz rate for deviations up to 10 kHz
Less than 3% at 1 kHz rate and deviations up to 100 kHz for carrier frequencies below 50 MHz

**Modulation source**

Internal modulation oscillator or external via front panel BNC

**FSK**

**Modes**

2 level or 4 level FSK

**Data source**

External data input via a 25 way rear panel D Type connector

**Frequency shift**

Variable up to ±100 kHz

**Accuracy**

As FM deviation accuracy

**Timing jitter**

±3.2 µs

**Filter**

8th order Bessel, -3 dB at 3.9 kHz
PHASE MODULATION

Deviation
0 to 10 radians

Resolution
3 digits or 0.01 radians

Accuracy at 1 kHz
±5% of indicated deviation excluding residual phase modulation

3 dB Bandwidth
100 Hz to 10 kHz

Distortion
Less than 3% at 10 radians at 1 kHz modulation rate. Typically <0.5% for deviations up to 1 radian at 1 kHz

Modulation source
Internal LF generator or external via front panel BNC.

AMPLITUDE MODULATION

Range
0 to 99.9%

Resolution
0.1%

Accuracy\(2\)
±5% of set depth at 1 kHz rate

1 dB Bandwidth
DC to 30 kHz (DC coupled)
10 Hz to 30 kHz (AC coupled)
20 Hz to 30 kHz (AC coupled with ALC)

Distortion\(2\)
<1.5% at 1 kHz rate for modulation depths up to 30%
<2.5% at 1 kHz rate for modulation depths up to 80%

Modulation source
Internal LF generator or external, via front panel BNC

PM on AM
Typically 0.1 radians at 30% depth at 470 MHz

PULSE MODULATION

Frequency range
32 MHz to 2.4 GHz, useable to 10 MHz

RF level range
Maximum guaranteed output is reduced by 5 dB when pulse modulation is selected

RF level accuracy
When pulse modulation is enabled, adds ±0.5 dB to the RF level accuracy specification

Control
Pulse input is on a front panel BNC with 10 kΩ nominal input impedance

A logic 0 (0 V to 1 V) turns the carrier off, a logic 1 (3.5 V to 5 V) turns the carrier on

Maximum input is ±15 V

On/off ratio
Better than 45 dB below 1.2 GHz, better than 40 dB above 1.2 GHz

Rise and fall times
Less than 10 µs

Overshoot
<1 dB

MODULATION OSCILLATOR

The internal modulation oscillator for each signal source is capable of generating one or two modulation tones simultaneously in one modulation channel.

Frequency range
0.01 Hz to 20 kHz with a resolution of 0.01 Hz

Frequency accuracy
As frequency standard

Distortion
Less than 0.1% THD at 1 kHz

Waveforms
Sine wave to 20 kHz and a triangular or square wave to 3 kHz

Square wave jitter
<6.4 µs on any edge

Audio Output
The modulation oscillator signal from each source is available on the front panel Modulation Input/Output BNC connector at a nominal level of 2 V RMS EMF from a 600 Ω source impedance.

EXTERNAL MODULATION

Input on the front panel Modulation Input/Output connector. The modulation is calibrated with 1.414 V peak (1 V RMS sine wave) applied. Input impedance is 100 kΩ nominal. Maximum safe input ±15 V.

MODULATION ALC
The external modulation input can be levelled by a peak levelling ALC system over the input voltage range of 0.75 V to 1.25 V RMS sine wave. High and low indicators in the display indicate when the input is outside levelling range.

SWEEP MODE

The carrier frequency of one source can be swept. To enable more than one source to be swept the coupling facility must be invoked.

Control parameters
Start/stop values of carrier frequency, frequency step size and time per step.

Step time
50 ms to 10 s per step

Trigger
A trigger input is available on a rear panel BNC connector and can be used in single, continuous, start/stop or single step mode.
**FREQUENCY STANDARD (OCXO)**

**Frequency**
10 MHz

**Ageing rate**
±2.5 in 10⁷ per year, ±5 in 10⁹ per day after 2 months continuous use.

**Temperature Stability**
Better than ±5 in 10⁹ over the temperature range 0 to 50°C.

**Warm up time**
Within 2 in 10⁷ of final frequency 10 minutes after switch on at a temperature of 20°C.

**External input/output**
Rear panel BNC connector accepts an external input of 1 MHz or 10 MHz at a level of 220 mV RMS to 1.8 V RMS into 1 kΩ. Rear panel BNC connector provides an output of 10 MHz at a nominal level of 2 V pk-pk into 50 Ω.

---

**GENERAL**

**GPIB INTERFACE**
All signal source parameters except the supply switch are remotely programmable.

Designed in accordance with IEEE 488.2.

**RS-232**
All signal source parameters except the supply switch are remotely programmable.
Connector is 9 way D type, baud rate 300 to 9600 bits per second.
Handshake hardware is DTR, RTS, CTS and DSR and software is XON and XOFF. Electrical interface is to EIA-232-D.

**ELECTROMAGNETIC COMPATIBILITY**
Conforms with the protection requirements of the EEC Council Directive 89/336/EEC. Conforms with the limits specified in the following standards:
IEC/EN61326-1 : 1997, RF Emission Class B, Immunity Table 1, Performance Criteria B

**SAFETY**
Conforms with the requirements of EEC Council Directive 73/72/EEC (as amended) and the product safety standard IEC/EN 61010-1 : 2001 + C1 : 2002 + C2 : 2003 for class 1 portable equipment, for use in a Pollution Degree 2 environment. The instrument is designed to be operated from an installation category 2 supply.

**RATED RANGE OF USE**
(Over which full specification is met unless otherwise indicated.)
Temperature 0 to 55°C, Humidity up to 93% at 40°C
Altitude up to 3050 m (10,000 ft)

**CONDITIONS OF STORAGE AND TRANSPORT**
Temperature -40 to +71°C, Humidity up to 93% at 40°C
Altitude up to 4600 m (15,000 ft)

**POWER REQUIREMENTS**

**AC SUPPLY**

**Voltage**
100 - 240 V ~ (Limit 90 - 264 V ~)

**Frequency**
50 - 60 Hz (Limit 45 - 66 Hz)

---

**Calibration interval**
2 years

**Dimensions and weight**
(over projections but excluding front panel handles)

Height    Width    Depth    Weight
177 mm   419 mm   488 mm   <17kg

---

**Options**

**OPTION 116 - GSM MODULATION**
Option 116 is available on 2026Q and 2026A/B signal generators.

**Baseband source**

**Data rate**
270.833333 kHz (13 MHz/48).

**Data rate accuracy**
As 10 MHz frequency standard.

**Filter**
Gaussian filter approximated by eight-pole RC network.

**Number of outputs**
3

**Data pattern**
(2¹⁵ -1) PRBS sequence.

The outputs are separated in time to ensure that they are not correlated.

**Accuracy**

**FM deviation**
Typically better than 2% when used as described.

**Spectral Characteristic**

**Wideband noise**
For an output of +10 dBm on the individual output typically -83 dBc measured in a 100 kHz bandwidth relative to the modulated signal measured in a 30 kHz bandwidth at 6 MHz offset, in accordance with ETSI-defined measurement methods on wideband noise.

---

(1) Level uncalibrated above +20 dBm for frequencies >1.2 GHz (-7 dBm at combiner output)
(2) Level accuracy is unspecified below 100 kHz for levels >+6 dBm
(3) For RF output levels not exceeding +10 dBm (-22 dBm at combiner output)

Our passion for performance is defined by three attributes represented by these three icons: solution-minded, performance-driven and customer-focused.
Signal Sources
2030 Series Signal generators

A high performance signal generator with programmable modulation sources and LF output, wide modulation bandwidths, sweep capability and excellent accuracy.

- Wideband cover:-
  10 kHz to 1.35 GHz (2030)
  10 kHz to 2.7 GHz (2031)
  10 kHz to 5.4 GHz (2032)
- 0.1 Hz frequency resolution
- 0.1 Hz to 500 kHz modulation oscillator
- Wideband FM with 10 MHz bandwidth
- Single, dual, composite and dual composite modulation modes
- GPIB programming (IEEE 488.2 standard)
- Simple operation through menu selection of modes

The 2030 series of signal generators offers increased flexibility with combinations of frequency, phase, amplitude and pulse modulation over the frequency ranges 10 kHz to 1.35 GHz (2030), 10 kHz to 2.7 GHz (2031) and 10 kHz to 5.4 GHz (2032). These instruments are suitable for a wide variety of applications ranging from RF component characterization to radio communications system testing. Set up time is reduced by recalling previously stored instrument settings from the non-volatile memory. Remote programming via the GPIB is provided as a standard feature, allowing the instruments to be included in automatic test systems.

Operation

Operation of the instrument is performed by simply selecting the required operating mode and entering parameter values using the numeric keypad. Parameter values may be varied by means of the rotary control knob or by use of the &darr;keys.

The Signal Generator, Sweep, LF, Delta, Memory and Utility displays are selectable at any point of operation using the keys below the screen. Within each display, soft keys are assigned alongside the display to allow parameter entry or to select the relevant functions.

Display

A large screen, dot matrix liquid crystal display, with backlighting, offers excellent clarity and low power consumption. Contrast may be varied using the knob to optimize the viewing angle and differing lighting conditions may be accommodated by adjusting the backlight intensity.

The parameters displayed on the screen depend on the operating mode selected; for example in the Signal Generator mode, carrier frequency, modulation and RF level are shown in separate horizontal regions. Status information is also shown with error messages being displayed in a single line at the top of the screen.
Frequency selection
Carrier frequency entry is selected via a soft key option on the signal generator screen and data is then entered directly via the keyboard. Frequency is resolved to within 0.1 Hz across the complete range of the instrument. Carrier frequencies can be stored in the non-volatile memory for recall at any time. A CARRIER ON-OFF switch is provided to completely disable the output.

RF Output
RF output up to +13 dBm can be set by direct keyboard entry with a resolution of 0.1 dB or better over the entire range. An extended hysteresis facility allows for extended electronic control of RF output level without introducing mechanical attenuator transients when testing squelch systems and an overrange facility allows the generator to produce RF levels above the normal operating range. A high output option is available to extend the maximum calibrated level to +19 dBm on 2030.

A low intermodulation mode can be selected which freezes the RF levelling system and improves the intermodulation performance when combining the outputs of two signal generators.

Calibration Units
A choice of calibration units is available to the operator and provision is made for the simple conversion of units (for example, dBm to mV). For units without Option 8 the output level can be offset by up to ±2 dB by keyboard entry. Offsets from the calibrated value may be used to compensate for cable or switching losses external to the generator. The operator may also use this facility as a means of deliberately offsetting the output level to ensure that all generators in an area give identical measurements. While using the offset facility, the calibration of the signal generator is not lost and may be returned to at any time.

Units with RF profile and complex sweep option (Option 8) have a much more comprehensive profiling and offsetting capability.

50 W Protection
An electronic trip protects the generator output against reverse power of up to 50 W, preventing damage to output circuits when RF or DC power is accidentally applied. This feature contributes to long unit life and low cost of ownership.

MODULATION
Comprehensive amplitude, frequency (plus Wideband FM), phase and optional pulse generation and modulation are provided for testing all types of receivers.

Modulation Oscillator
An internal modulation oscillator is provided with a frequency range of 0.1 Hz to 500 kHz, resolved to 0.1 Hz. In addition to the normal sine wave output, alternative triangular or square waveforms may be selected. A second oscillator may be added as an option. Two independent BNC inputs on the front panel allow external modulation signals to be mixed with the internal signal(s) allowing a maximum of four modulations channels to be active at one time.

Modulation Modes
Four modulation modes are provided – single, dual, composite and dual composite. In the single mode only one type of modulation can be active at any time. Selecting alternative modulation cancels any other active modulation. In the dual mode two types of modulation may be obtained allowing one form of frequency modulation to be combined with one form of amplitude modulation. In the composite mode, only one type of modulation can be active, and is fed by two independent channels. The dual composite mode combines the facilities of the dual mode with the composite mode and provides two types of modulation each fed from two sources.

Frequency and Phase Modulation
The wide range frequency modulation capability provides a 1 dB bandwidth of 300 kHz and provides FM deviation up to a maximum of 1 MHz for frequencies up to 21 MHz and 1% of carrier frequency else-where. Phase modulation is also available with a 10 kHz bandwidth up to a maximum of 10 radians.

Both AC and DC coupled FM are available and in the DC coupled mode a patented offset correction system eliminates the large carrier frequency offsets that occur with normal signal generators. As a result the 2030 series signal generators can be used confidently for testing tone and message paging equipment.

Wideband FM
Broadband frequency modulation with a 3 dB bandwidth of 10 MHz is provided via a rear panel BNC socket. This is ideal for tests on equipment using frequency shift keying for high speed digital transmission.

Amplitude and Pulse Modulation
Amplitude modulation with a 1 dB band-width of 30 kHz and with modulation depths of up to 99.9% is available with a resolution of 0.1%. Pulse modulation is available as an option with typical rise and fall times of 5 ns and 70 dB on/off ratio.

Modulation Levelling
An automatic level control facility is provided for both of the external modulation inputs and provides correctly calibrated modulation for input levels varying from 0.7 V to 1.4 V RMS. HI and LO indications show when the input level is outside the range of the ALC system.

Tone Signaling
The signaling facility allows testing of radios with DTMF, sequential and sub-audible tone capability. A wide range of tone system standards are built in and provision is also made for user definable standards to cover special requirements. Tone sequences can be set up with up to 16 tones in length and the complete sequence can be sent from 1 to 9 times or set to repeat on a continuous basis. Sub-audible tones are normally used in the composite modulation mode where the modulation level for the tone and the in-band modulation can be set independently.
INCORPORATING

All major parameters can be incremented or decremented in step sizes entered via the keyboard or the GPIB.

Θ Ø keys

If the knob is disabled, a single touch on either the Θ or Ø key moves the parameter by a single step and holding the key pressed causes the signal generator to step continuously at a rate of about three steps per second.

Rotary Control

When the rotary control is enabled the parameters can be varied using the knob, whose sensitivity may be altered by factors of ten using the Θ and Ø keys. The digits affected by the rotary control are indicated on the display by lines above and below the numeric display.

Delta Display

The Delta menu allows the increment for all the parameters to be set and also includes a TOTAL SHIFT key to show the variations in the parameters from their last keyed in value, a RETURN key to reset the selected parameter to its start value and a TRANSFER key to update the parameter value to equal the shifted value.

SWEEP

The digital sweep capability of the 2030 series allows dynamic testing of systems and includes capabilities for sweeping carrier frequency, RF level, LF frequency and LF level. Four parameters are entered to specify the sweep – start value, stop value, number of steps and time per step.

Option 8 provides additional sweep capabilities which allow the step size, step time and RF level to be entered.

Markers and Ramp Output

Six markers may be defined and a marker output is provided on a rear panel socket together with a 0-10 V ramp signal for driving the X axis of an oscilloscope or X-Y plotter.

Start/Stop

A single key press starts the sweep and a horizontal bar graph on the display shows the progress of the sweep. The sweep can be stopped at any time and the Θ Ø keys used to step forwards or backwards for search purposes. Transfer of the current sweep value into the signal generator or LF modes for more detailed analysis is also possible. The sweep facility can be used in conjunction with a simple X-Y display unit, an oscilloscope or an X-Y plotter.

NON-VOLATILE MEMORY

True non-volatile memory needing no battery back-up is fitted to the 2030 series and is used to store details of instrument settings and calibration information.

Instrument Settings

Details of instrument settings are stored in four areas of memory. One area stores 50 complete instrument settings (including data on parameters which are not currently active), a second area stores 50 partial settings (consisting of details about the currently active parameters), a third area stores details of 100 carrier frequency values and a fourth area stores details of 20 sweep settings. Facilities are provided to prevent the memories from being accidentally overwritten and for recalling a specified memory at switch-on.

Calibration Data

In addition to storage and recall of measurement settings, the non-volatile memory contains data on instrument status and calibration. All calibration data on RF level, FM accuracy, internal frequency standard adjustment and modulation are retained and may be altered from the front panel or via the GPIB after disabling the software protection. Status information stored includes the identity string (type and serial number), choice of internal/external standard, GPIB address, elapsed time and a date alarm for calibration due reminders.

Memory Content Protection

To prevent accidental interference with the contents of status and calibration data, internal data is protected by a secure key sequence. Two levels of protection are offered, appropriate to the function being accessed. The most secure is reserved for features that alter the calibration data, change the time and date setting or blank the displays when memories are recalled. The first level of protection is less severe, enabling the user to access features which are relevant to normal operation, for example, selection of RF level calibration units, RF level offsets, external standard frequency and switch-on status.

Unprotected features provide a range of additional operating features, such as the ability to display status information, elapsed time, time and date, etc.

PROGRAMMING

A GPIB interface is fitted as standard so that all functions are controllable over this interface. The instruments function as talkers as well as listeners and the interface has been designed in accordance with the IEEE 488.2 standard.

CALIBRATION

The 2030 series has a two year recommended calibration interval, with the user being able to calibrate some functions. The calibration display is available via soft key selection in the utilities menu.

Software Assisted Calibration

When carrying out calibration manually (via the keyboard), the instrument displays information on the procedure and in the case of FM tracking even carries out the full adjustment process automatically. No internal adjustments are provided, or required, for calibration and even the internal frequency standard can be adjusted from the front panel. Calibration may also be carried out via the GPIB allowing a fully automated recalibration of all parameters to be performed.
Automatic Date Stamping

Having completed a readjustment of a parameter the instrument updates the calibration data and uses the information from the real time clock to record the date of adjustment. The calibration engineer can also set a calibration due date and when this date is reached a message will be displayed advising the operator to return the unit for calibration.

Low Cost of Ownership

In keeping with the IFR philosophy of cost-effectiveness with innovation, the 2030 series has been designed for minimal maintenance and low operating costs. The two year calibration interval combined with the high reliability ensures a low overall cost of ownership.

OPTIONS

The standard features may be supplemented by taking advantage of the various options available. See list below.

Option 1 - Second Modulation Oscillator

An additional modulation oscillator can be fitted to the 2030 series to enable greater flexibility. This second oscillator has the same specification as the first and allows full use of complex modulation modes and is particularly useful where two tone modulation is required.

Option 2 - Pulse Modulation

This optional facility allows radar RF and IF stages to be tested and features rise and fall times of less than 25 ns with an on/off ratio of better than 70 dB.

Option 3 - 19 dBm Output

A high output option is available for 2030 and provides an extra 6 dB of calibrated output level making it ideal for use as a local oscillator or in testing passive components.

Option 9 - Internal Pulse Generator

Provides internal pulses which, when used with pulse modulation, generates pulsed RF outputs to eliminate the need for an external function generator.

Option 5 - GSM PCN Modulation

An option is available for 2030 series which provides GMSK Bt 0.3 modulation at a clock rate of 270,833 kHz in accordance with the GSM specification. The option includes a comprehensive internal data generator.

Option 6 - Avionics & DME

This optional facility provides for the internal generation modulation waveforms suitable for the testing of Instrument Landing Systems (ILS) and VHF Omni Range (VOR) beacons.

Additional modes of operation support the testing of ADF, Marker Beacons and the SELCAL signaling system.

Another additional option creates Gaussian shaped double pulses to produce the correct DME RF signals to test DME receivers.

Option 8 - RF Profiles and Complex Sweep

The RF Profile facility allows the signal generator to compensate for frequency dependent level errors introduced by cables, amplifiers and signal combiners. The Complex Sweep facility allows for the generation of sweeps whose step size, step time and RF level change while the sweep is in progress. These features are particularly useful for EMC, Tempest and ATE applications.

Electronic Attenuator

An electronic attenuator option is available to meet demanding extended life requirements for repetitive switching, found in high volume production applications.

SPECIFICATION

GENERAL DESCRIPTION

2030 series signal generators cover the frequency ranges of 10 kHz to 1.35 GHz, 10 kHz to 2.7 GHz and 10 kHz to 5.4 GHz. A large screen dot matrix display with soft key function selection allows flexibility of operation and ease of use. The output may be amplitude, phase or frequency modulated with pulse generation and modulation available as an option. Modulation is available using a combination of an internal synthesized LF oscillator with up to two external signal inputs.

A second internal source is available as an option.

CARRIER FREQUENCY

Range

- 10 kHz to 1.35 GHz (2030)
- 10 kHz to 2.7 GHz (2031)
- 10 kHz to 5.4 GHz (2032)
Selection
By keyboard entry of data
Variation by +/− keys and by rotary control

Indication
11 digits with annunciators

Resolution
0.1 Hz

Accuracy
As frequency standard

Phase incrementing
The carrier phase can be advanced or retarded in steps of 1.5° using the rotary control.

**RF OUTPUT**

Range
-144 dBm to +13 dBm. When AM is selected the maximum output level reduces linearly with AM depth to +7 dBm at maximum AM depth.

Overrange
Selectable overrange mode allows uncalibrated levels up to +19 dBm to be generated (typically up to +25 dBm for 2030 with Option 003 fitted).

Selectable extended hysteresis provides for uncalibrated RF level control with up to 24 dB range without level interruption.

Selection
By keyboard entry of data. Variation by UP/DOWN keys and by rotary control. Units may be µV, mV, V EMF or PD; dB relative to 1 µV, 1 mV EMF or PD; dBm. Conversion between dB and voltage units may be achieved by pressing the appropriate units key (dB, or V, µV, mV).

Indication
4 digits with unit annunciators

Resolution
0.1 dB

VSWR
For output levels less than 0 dBm: Less than 1.25:1 to 2.2 GHz, less than 1.4:1 to 2.7 GHz, less than 1.5:1 to 5.4 GHz.

Output Protection
Reverse power of 50 W from a source VSWR of up to 5:1.

Accuracy at 22°C ±5°C

Sub-harmonics
Better than -90 dBc to 1.35 GHz; better than -40 dBc to 2.3 GHz; better than -30 dBc to 5.4 GHz.

Non-Harmonics
Better than -70 dBc at offsets from the carrier frequency of 3 kHz or greater.

Residual FM (FM off)
Less than 7 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 470 MHz.

SSB phase noise
Less than -116 dBc/Hz (typically -122 dBc/Hz) at an offset of 20 kHz from a carrier frequency of 470 MHz.

RF Leakage
Less than 0.5 µV PD at the carrier frequency in a two turn 25 mm loop, 25 mm or more from any part of the case.

FM on AM
Typically less than 100 Hz for 30% AM depth at a modulation frequency of 1 kHz and a carrier frequency of 500 MHz.

ΦM on AM
Typically less than 0.1 radians at a carrier frequency of 500 MHz for 30% AM depth for modulation rates up to 10 kHz.

**MODULATION MODES**

Four modulation modes are available:

- **Single**
  FM, Wideband FM, ΦM, AM or pulse (optional)

- **Dual**
  Two independent channels of differing modulation type (e.g. AM with FM).

- **Composite**
  Two independent channels of the same modulation type (e.g. FM1 with FM2).

- **Dual composite**
  A combination of Dual and Composite modes providing four independent channels (e.g. AM1 with AM2 and FM1 with FM2).

**FREQUENCY MODULATION**

Deviation
Peak deviation from 0 to 1 MHz for carrier frequencies up to 21.09375 MHz. Peak deviation from 0 to 1% of carrier frequency above 21.09375 MHz.

Selection
By keyboard entry of data

Indication
3 digits with annunciators

Displayed Resolution
1 Hz or 1 least significant digit, whichever is greater

Accuracy at 1 kHz
±5% of indication ±10 Hz excluding residual FM
**Bandwidth (1 dB)**
- DC to 300 kHz (DC coupled)
- 10 Hz to 300 kHz (AC coupled)

Input is capable of accepting external sources of FSK signals. Typical 3 dB bandwidth is greater than 1 MHz.

**Group delay**
- Less than 1 µs from 3 kHz to 500 kHz

**Carrier Frequency Offset**
- In DC FM less than ±(1 Hz + 0.1% of set deviation) after using DC FM nulling facility.

**Distortion**
- Using external modulation without ALC: Less than 3% at maximum deviation for modulation frequencies up to 20 kHz. Less than 0.3% at 10% of maximum deviation for modulation frequencies up to 20 kHz.

**Modulation Source**
- Internal LF generator or external via front panel sockets.

**Wideband FM**

**Deviation**
- As FM

**Indication**
- 3 digits with annunciators

**Selection**
- By keyboard entry of data. The sensitivity is controlled in 3 dB steps and the display will indicate the value of deviation nearest to the requested value.

**Input level**
- 1.414 V peak (1 V RMS sine wave) to achieve indicated deviation.

**Accuracy**
- As FM

**3 dB Bandwidth**
- Typically 10 MHz (DC or AC coupled)

**Group Delay**
- Less than 0.5 µs from 3 kHz to 10 MHz

**Modulation Source**
- External via BNC on rear panel, 50 Ω input impedance

**Phase Modulation**

**Deviation**
- 0 to 10 radians

**Selection**
- By keyboard entry of data

**Indication**
- 3 digits with annunciators

**Resolution**
- 0.01 radians

**Accuracy at 1 kHz**
- ±5% of indicated deviation excluding residual phase modulation

**3 dB Bandwidth**
- 100 Hz to 10 kHz

**Distortion**
- Less than 3% at maximum deviation at 1 kHz modulation rate

**Modulation Source**
- Internal LF generator or external via front panel sockets

**Amplitude Modulation**

**For carrier frequencies up to 1 GHz**

**Range**
- 0 to 99.9%

**Selection**
- By keyboard entry of data

**Indication**
- 3 digits with annunciator

**Resolution**
- 0.1%

**Accuracy**
- ±4% of setting ±1%

**1 dB Bandwidth**
- With modulation ALC off: DC to 30 kHz in DC coupled mode and 10 Hz to 30 kHz in AC coupled mode

**Typical modulation bandwidth exceeds 50 kHz**

**Distortion**
- For a modulation rate of 1 kHz: Less than 1% total harmonic distortion for depths up to 30%, less than 3% total harmonic distortion for depths up to 80%.

**Modulation Source**
- Internal LF generator or external via front panel sockets

**Modulation Oscillator**

**Frequency range**
- 0.1 Hz to 500 kHz

**Selection**
- By keyboard entry of data

**Indication**
- 7 digits with annunciators

**Resolution**
- 0.1 Hz

**Frequency accuracy**
- As frequency standard

**Distortion**
- Less than 0.1% THD in sine wave mode at frequencies up to 20 kHz

**Alternative waveforms**
- A triangular wave is available for frequencies up to 100 kHz
- A square wave is available for frequencies up to 2 kHz
Signaling tones
The modulation oscillator can be used to generate sequential (up to 16 tones) or sub-audible signaling tones in accordance with EIA, ZVEI, DZVEI, CCIR, EURO 1, EEA, NATAL and DTMF standards.
Facilities are also available for creating and storing user defined tone system.
* Requires second modulation oscillator (option 001) to be fitted.

EXTERNAL MODULATION
Two independent inputs on the front panel with BNC connectors, EXT MOD 1 and EXT MOD 2. The modulation is calibrated with 1.414 V peak (1 V RMS sine wave) applied.
Input impedance 100 kΩ nominal

MODULATION ALC
The EXT MOD 1 and EXT MOD 2 modulation inputs can be levelled by an ALC system
Level Range
1 V to 2 V peak (0.7 V RMS to 1.4 V RMS sine wave)
Distortion
Less than 0.1% additional distortion for frequencies up to 20 kHz (typically less than 0.1% up to 50 kHz)
1 dB Bandwidth
Typically 10 Hz to 500 kHz

LF OUTPUT
Front panel BNC connector. The output may be configured in the LF Generator Mode to give an output from the internal modulation oscillator and in the LF Monitor Mode to give an output from the internal modulation signal paths.
Selection
By keyboard entry of data
Variation by 2-5 keys and by rotary control
Indication
7 digits with unit annunciators for frequency and 3 digits with unit annunciators for level
Level
100 µV to 5 V RMS with a load impedance of greater than 600 Ω.
100 µV to 1.4 V RMS with a load impedance of greater than 50 Ω
Source impedance
5.6 Ω nominal
Level accuracy at 1 kHz
With a load impedance of greater than 10 kΩ ±5% for levels above 50 mV and ±10% for levels from 500 µV to 50 mV.
Frequency response
Typically better than ±1 dB, 0.1 Hz to 300 kHz

SWEEP
Control modes
Start/stop values of selected parameter. Number of steps. Time per step.

Stop time
1 ms to 10 s per step
Sweep ramp
Synchronized analog ramp with a nominal amplitude of 0 to 10 V peak on rear panel BNC connector
Markers
User selectable markers for frequency or level provide an indication when specified parameter values have been reached. Output 0 V to +5 V from 600 Ω on rear panel BNC socket.
Trigger
Rear panel BNC connector. Applying 0 V or a switch closure starts the sweep. Socket is internally connected via 10 kΩ pull-up resistor to +5 V.

FREQUENCY STANDARD OCXO
Frequency
10 MHz
Temperature stability
Better than ±5 in 10⁸ over the operating range of 0 to 50°C
Warm up time
Within 2 in 10⁸ of final frequency within
10 minutes from switch on at 20°C ambient
Ageing rate
Better than 2 in 10¹ per year
Output
Rear panel BNC socket provides an output at frequencies of 1, 5 or 10 MHz with a nominal 2 V pk-pk level into 50 Ω. This output can be disabled.
External input
Rear panel BNC socket accepts an input at 1, 5 or 10 MHz with an input level in the range 220 mV to 1.8 V RMS into 1 kΩ.

GENERAL
GPIB INTERFACE
A GPIB interface is fitted as standard. All functions except the supply switch and display contrast are remotely programmable.
Capabilities
Designed in accordance with IEEE 488.2.
Complies with the following subsets as defined in IEEE Std.488.1. SH1, SH1, T6, L4, SR1, RL1, PP0, DC1, DT1, CO, E2.

ELECTROMAGNETIC COMPATIBILITY
Conforms with the protection requirements of the EEC Council Directive 89/336/EEC. Conforms with the limits specified in the following standards: IEC/EN61326-1 : 1997, RF Emission Class B, Immunity Table 1, Performance Criteria B

SAFETY
Conforms with the requirements of EEC Council Directive 73/23 EEC (as amended) and the product safety standard IEC / EN 61010-1 : 2001 + C1 : 2002 + C2 : 2003 for class 1 portable equipment, for use in a Pollution Degree 2 environment. The instrument is designed to be operated from an Installation Category 2 supply.

RATED RANGE OF USE
(Over which full specification is met)
Temperature
0 to 55°C
Humidity
Up to 93% at 40°C

CONDITIONS OF STORAGE AND TRANSPORT
Temperature
-40 to +71°C
Humidity
Up to 93% relative humidity at 40°C
Altitude
Up to 4600 m (15,000 ft)

POWER REQUIREMENTS
AC supply
Four voltage settings covering:
100 V~ (Limit 90 - 115 V~)
120 V~ (Limit 105 - 132 V~)
220 V~ (Limit 188 - 242 V~)
240 V~ (Limit 216 - 264 V~)
Frequency: 50 - 400 Hz (Limit 45 - 440 Hz) 180 VA max

CALIBRATION INTERVAL
2 years

DIMENSIONS AND WEIGHT

OPTIONS

OPTION 1 - SECOND MODULATION OSCILLATOR OPTION
Specification as Modulation Oscillator

OPTION 2 - PULSE MODULATION OPTION
Modulation Modes
Pulse modulation may be used alone or in conjunction with FM, ØM or Wideband FM
Rise Time
25 ns (Typically 5 ns)
Control
0 V for carrier off, +5 V for carrier on
Threshold level typically +2.5 V
ON/OFF Ratio
Better than 70 dB
Input impedance
50 Ω

OPTION 105 - SLOWRISETIMEPULSEMODULATION
Modifies pulse modulation option for a typical rise and fall time of 2 μs

OPTION 3 - +19 dBm RF OUTPUT LEVEL OPTION
For 2030 model only
RF Output Range
-144 dBm to +19 dBm. When AM is selected the maximum output level reduces linearly with AM depth to +13 dBm at maximum AM depth.

Harmonics
At RF levels up to +7 dBm: better than –27 dBc

OPTION 5 - GSM/PCN/PCS OPTION
See separate sheet

OPTION 6 - AVIONICS OPTION
See separate sheet

OPTION 8 - RF PROFILE AND COMPLEX SWEEP
See separate sheet

OPTION 9 - INTERNAL PULSE GENERATOR OPTION
See separate sheet

OPTION 10 - DME OPTION
See separate sheet

OPTION 12 - ELECTRONIC ATTENUATOR
Carrier Frequency Range
250 kHz* to 1.35 GHz (2030),
250 kHz* to 2.7 GHz (2031).
* Useable to 10 kHz
RF Output Range
-138 dBm to +10 dBm. When AM is selected the maximum output level reduces linearly with AM depth to +4 dBm at maximum AM depth.

Accuracy
±1.2 dB for output levels >-127 dBm at 22°C ±5°C
Temperature Stability
±0.01 dB/°C
VSQR
<1.5:1 for output levels less than 0 dBm
Reverse Power Handling
1 W from a source VSWR of up to 5:1
Amplitude Modulation
Standard specification applies for carrier frequencies above 50 MHz (Above 100 MHz for Option 6).

Options

- **Option 001**: Second internal modulation oscillator
- **Option 002**: Pulse Modulation
- **Option 003**: +19 dBm Output Level (2030 only)
- **Option 005**: GSM/PCN/PCS (GMSK Bt 0.3 Modulation)
- **Option 006**: Avionics (requires Option 001, cannot be used with Option 003)
- **Option 008**: RF Profiles and Complex Sweep
- **Option 009**: Internal Pulse Generator. Requires Option 002
- **Option 010**: DME (requires Option 001 and 006, cannot be used with Option 003 or Option 005)
- **Option 012**: Electronic Attenuator (2030 and 2031 only). Not available with options 003 or 010
- **Option 015**: Modifies the Pulse Modulation option for slower rise and fall time (order with option 002)
- **Option 105**: External modulation inputs (2) 600 Ω impedance

Optional Accessories

- 46880/047 Service manual
- 43126/012 RF connector cable, 50 Ω, 1.5 m, BNC
- 54311/092 Coaxial adapter N male to BNC female
- 59999/163 Precision coaxial adapter N male to SMA female
- 54311/095 RF connector cable, 1 m, type N connectors
- 43129/189 GPIB Lead assembly
- 46883/408 IEEE/IEC Adapter block for GPIB socket
- 46884/291 Rack mounting kit (with slides) for rack cabinets with depths from 480 mm to 680 mm
- 46884/292 Rack mounting kit (with slides) for rack cabinets with depths from 680 mm to 840 mm
- 46884/541 Rack mounting kit containing front mounting brackets only
- 46884/444 Maintenance kit for 2030 series
- 46662/525 Transit case
- 54112/164 Soft carry case
- 54499/044 DECT Filter

Supplied with

- AC supply lead
- Operating Manual
As we are always seeking to improve our products, the information in this document gives only a general indication of the product capacity, performance and suitability, none of which shall form part of any contract. Signal Sources

2040 Series Low Noise Signal Generator

Excellent noise characteristics and low spurious signals for a wide range of critical measurements

- Wide band cover:
  - 10 kHz to 1.35 GHz (2040)
  - 10 kHz to 2.7 GHz (2041)
  - 10 kHz to 5.4 GHz (2042)

- Low residual FM noise: 0.3 Hz RMS at 1 GHz

- Low spurious signals: –90 dBc non-harmonics

- Low phase noise: –140 dBc/Hz at 1 GHz

- Comprehensive modulation modes

- +13 dBm output (+19 dBm optional)

- 0.1 Hz to 500 kHz modulation oscillator

- Comprehensive frequency and amplitude sweep capabilities

The 2040 series of low noise signal generators covers a wide range of frequencies from 10 kHz to 1.35 GHz (2040), 10 kHz to 2.7 GHz (2041) and 10 kHz to 5.4 GHz (2042). With a choice of operating modes, two low noise modes for improved SSB phase noise and normal mode for increased flexibility, the 2040 series can be used in a wide variety of applications. Microprocessor control coupled with a large screen dot matrix display provides ease of use via menu driven displays. Set up time is further reduced by recalling previously stored instrument settings from the non-volatile memory. Remote programming via the GPIB is provided as a standard feature, allowing the instruments to be incorporated in automatic test systems.

Excellent Spectral Purity

The excellent noise characteristics and the low level of spurious signals of the 2040 series enable the instruments to be used with confidence for a wide range of critical measurements.

Low SSB Phase Noise

With a specified SSB phase noise performance of better than –140 dBc/Hz at 20 kHz offset from a carrier of 1 GHz, the 2040 series of signal generators is easily able to measure UHF receiver selectivities beyond 90 dB.

The low residual FM noise figure (less than 0.3 Hz RMS at 1 GHz) gives the 2040 series the capability of measuring UHF receiver signal to noise ratios as high as 80 dB.

Typical phase noise performance at 1 GHz

Low spurious signal content

A specified non-harmonic spurious signal content of –90 dBc ensures the suitability of the 2040 series for the most demanding measurements on modern receivers and RF systems.
external modulation signals to be mixed with the internal signal(s) as an option. Two independent BNC inputs on the front panel allow selected for sweep applications. A second oscillator may be added as an alternative triangular or square waveform may be produced of 0.1 Hz to 500 kHz, resolved to 0.1 Hz. In addition to the normal sine wave output an alternative triangular or square waveform may be selected for sweep applications. A second oscillator may be added as an option, Two independent BNC inputs on the front panel allow external modulation signals to be mixed with the internal signal(s) allowing a maximum of four modulation channels to be active at one time.

**Modulation Modes**

Four modulation modes are provided – single, dual, composite and dual composite. In the single mode only one type of modulation can be active at any time. Selecting alternative modulation cancels any other active modulation. In the dual mode two types of modulation may be obtained allowing one form of frequency modulation to be combined with one form of amplitude modulation. In the composite mode, only one type of modulation can be active, and is fed by two independent channels. The dual composite mode combines the facilities of the dual mode with the composite mode and provides two types of modulation each fed from two sources.

**Frequency and Phase Modulation**

The wide range frequency modulation capability provides a 1 dB bandwidth of 300 kHz and provides FM deviation up to a maximum of 1 MHz for frequencies up to 21 MHz, 1% of carrier frequency elsewhere. Phase modulation is also available with a 10 kHz bandwidth up to a maximum of 10 radians.

Both AC and DC coupled FM are available and in the DC coupled mode a patented offset correction system eliminates the large carrier frequency offsets that occur with normal signal generators. As a result the 2040 series signal generators can be used confidently for testing tone and message paging equipment.

**Wideband FM**

Broadband frequency modulation with a 3 dB bandwidth of 10 MHz is provided via a rear panel BNC socket. This is ideal for tests on equipment using frequency shift keying for high speed digital transmission.

**Amplitude and Pulse Modulation**

Amplitude modulation with a 1 dB bandwidth of 30 kHz and with modulation depths of up to 99.9% is available with a resolution of 0.1%. Fast pulse modulation is available as an option with rise and fall times of less than 25 ns and a 70 dB on/off ratio.

**Modulation Levelling**

An automatic level control facility is provided for both of the external modulation inputs and provides correctly calibrated modulation for input levels varying from 0.7 to 1.4 V RMS. HI and LO indications show when the input level is outside the range of the ALC system.

**Tone Signaling**

The signaling facility allows testing of radios with DTMF, sequential and sub-audible tone capability. A wide range of tone system standards are built in and provision is also made for user definable standards to cover special requirements. Tone sequences can be set up with up to 16 tones in length and the complete sequence can be sent from 1 to 9 times or set to repeat on a continuous basis. Sub-audible tones are normally used in the composite modulation mode where the modulation level for the tone and the in-band modulation can be set independently.
Delta Display
The Delta menu allows the increment values for all the parameters to be set and also includes a "TOTAL SHIFT" key to show the variations in the parameters from their last keyed in value, a "RETURN" key to reset the selected parameter to its start value and a "TRANSFER" key to update the parameter value to equal the shifted value.

FREQUENCY AND LEVEL SWEEP
The digital sweep capability of the 2040 series allows dynamic testing of systems and includes capabilities for sweeping carrier frequency, RF level, LF frequency and LF level. Four parameters are entered to specify the sweep – start value, stop value, number of steps and time per step.

Markers and Ramp Output
Five markers may be defined and a marker output is provided on a rear panel socket together with a 0 to 10 V ramp signal for driving the X axis of an oscilloscope or X-Y plotter.

Option 8 provides additional sweep capabilities which allow the step size, step time and RF level to be entered.

Start/Stop
A single key press starts the sweep and a horizontal bar graph on the display shows the progress of the sweep. The sweep can be stopped at any time and the Up/Down keys used to step forwards or backwards for search purposes. Transfer of the current sweep value into the signal generator or LF modes for more detailed analysis is also possible. The sweep facility can be used in conjunction with a simple X-Y display unit, an oscilloscope or an X-Y plotter.

POWERFUL NON-VOLATILE MEMORY
True non-volatile memory needing no battery back-up is fitted to the 2040 series and is used to store details of instrument settings and calibration information.

Instrument Settings
Details of instrument settings are stored in four areas of memory. One area stores 50 complete instrument settings (including data on parameters which are not currently active), a second area stores 50 partial settings (consisting of details about the currently active parameters), a third area stores details of 100 carrier frequency values and a fourth area stores details of 20 sweep settings. Facilities are provided to prevent the memories from being accidentally overwritten and for recalling a specified memory at switch-on.

Calibration Data
In addition to storage and recall of measurement settings, the non-volatile memory contains data on instrument status and calibration. All calibration data on RF level, FM accuracy, internal frequency standard adjustment and modulation are retained and may be altered from the front panel or via the GPIB after disabling the software protection. Status information stored includes the identity string (type and serial number), choice of internal/external standard, GPIB address, elapsed time and a date alarm for calibration due reminders.

GPIB 488.2 PROGRAMMING
A GPIB interface is fitted as standard so that all functions are controllable over the bus. The instruments function as talkers as well as listeners and the interface has been designed in accordance with the IEEE 488.2 standard.

SIMPLE CALIBRATION
The 2040 has a two year recommended calibration interval, with all routine calibration adjustments carried out without removing the instrument covers. The calibration display is available via soft key selection in the utilities menu.

Low Cost of Ownership
In keeping with the IFR philosophy of cost effectiveness with innovation, the 2040 series has been designed for minimal maintenance and low operating costs. The two year calibration interval combined with the high reliability ensures a low overall cost of ownership.

OPTIONS EXTEND RANGE OF APPLICATIONS
The standard features may be supplemented by taking advantage of the various options available.

Option 1 - Second Modulation Oscillator
An additional modulation oscillator can be fitted to the 2040 series to enable greater flexibility. This second oscillator has the same specification as the first and allows full use of complex modulation modes and is particularly useful where two tone modulation is required.

Option 2 - Pulse Modulation
This optional facility allows radar RF and IF stages to be tested and features rise and fall times of less than 25 ns with an on/off ratio of better than 70 dB.

Option 3 - +19 dBm RF Output Level
A high output option is available for 2040 and provides an extra 6 dB...
of output level making it ideal for use as a local oscillator or in testing passive components.

Option 6 - Avionics

This optional facility provides for the internal generation of modulation waveforms suitable for the testing of Instrument Landing Systems (ILS) and VHF Omni Range (VOR) beacons. Additional modes of operation support the testing of ADF, Marker Beacons and the SELCAL signaling system.

Option 8 - RF Profiles and Complex Sweep

The RF Profile facility allows the signal generator to compensate for frequency dependent level errors introduced by cables, amplifiers and signal combiners. The Complex Sweep facility allows for the generation of sweeps whose step size, step time and RF level changes while the sweep is in progress. These features are particularly useful for EMC, Tempest and ATE applications.

Option 11 - Electronic Attenuator

An electronic attenuator option is available to meet demanding extended life requirements for repetitive switching, found in high volume production applications.

SPEcification

General Description

2040 series signal generators cover the frequency ranges 10 kHz to 1.35 GHz, 10 kHz to 2.7 GHz, and 10 kHz to 5.4 GHz. A large screen dot matrix display with soft key function selection allows flexibility of operation and ease of use. The output may be amplitude, phase or frequency modulated with pulse modulation available as an option. Modulation is available using a combination of an internal synthesized LF oscillator with up to two external signal inputs. A second internal source is available as an option.

Carrier Frequency

Range

10 kHz to 1.35 GHz (2040).

10 kHz to 2.7 GHz (2041).

10 kHz to 5.4 GHz (2042).

Overrange

Selectable overrange mode allows uncalibrated levels up to +19 dBm to be generated (typically up to +25 dBm for 2030/40 with Option 003 fitted).

Selectable extended hysteresis provides for uncalibrated RF level control with up to 24 dB range without level interruption.

Selection

By keyboard entry of data. Variation by UP/DOWN keys and by rotary control.

Indication

11 digits with annunciators.

Resolution

0.1 Hz.

Accuracy

As frequency standard.

Phase Incrementing

The carrier phase can be advanced or retarded in steps of π/128 radians (approximately 1.4°) using the rotary control.

RF Output

Range

–144 dBm to +13 dBm.

When AM is selected the maximum output level reduces linearly with AM depth to +7 dBm at maximum AM depth.

Selection

By keyboard entry of data. Variation by UP/DOWN keys and by rotary control. Units may be µV, mV, V EMF or PD; dB relative to 1 µV, 1 mV EMF or PD; dBm.

Conversion between dB and voltage units may be achieved by pressing the appropriate units key (dB, or V, µV, mV).

Indication

4 digits with unit annunciators.

Resolution

0.1 dB.

Accuracy At 22°C ±5°C

Temperature stability dB/°C

±0.005 ±0.01 ±0.02

VSWR

For output levels less than 0 dBm:

Less than 1.25:1 to 2.2 GHz.

Less than 1.4:1 to 2.7 GHz.

Less than 1.5:1 to 5.4 GHz.

Output Protection

Reverse power of 50 W from a source VSWR of up to 5:1.

Noise Modes

Three noise modes are offered with the following characteristics:

Low Noise Mode 1

Lowest phase noise with a restricted FM deviation capability and reduced AM bandwidth.

Low Noise Mode 2

Low phase noise with restricted FM deviation capability and full AM bandwidth.

Normal Mode

Full FM deviation capability and AM bandwidth.
SPECTRAL PURITY

At RF levels up to +7 dBm:

Harmonics

2040, 2041:
Better than –30 dBc to 1 GHz;
Better than –27 dBc above 1 GHz.

2042:
Better than –30 dBc to 1 GHz;
Better than –27 dBc to 1.35 GHz;
Better than –25 dBc above 1.35 GHz.

Sub-Harmonics

Better than –90 dBc to 1.35 GHz.
Better than –40 dBc to 2.3 GHz.
Better than –30 dBc to 5.4 GHz.

Non-Harmonics (offsets greater than 3 kHz)

In low noise modes:
Better than –70 dBc up to 21.09375 MHz.
Better than –90 dBc from 21.09375 MHz to 2.7 GHz.
Better than –84 dBc above 2.7 GHz.

In normal mode:
Better than –70 dBc.

Residual FM (FM off)

Low noise mode: Less than 0.3 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 1 GHz.
Normal mode: Less than 7 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 470 MHz.

RF Leakage

Less than 0.5 mV PD at the carrier frequency in a two turn 25 mm loop 25 mm or more from any part of the case.

FM on AM

Typically less than 100 Hz for 30% AM depth at a modulation frequency of 1 kHz and a carrier frequency of 500 MHz.

ΦM on AM

Typically less than 0.1 radians at a carrier frequency of 500 MHz for 30% AM depth for modulation rates up to 10 kHz.

MODULATION MODES

Four modulation modes are available:

Single

FM, Wideband FM, ΦM, AM or Pulse (optional).

Dual

Two independent channels of differing modulation type (e.g. AM with FM).

Composite

Two independent channels of the same modulation type (e.g. FM1 with FM2).

Dual composite

A combination of Dual and Composite modes providing four independent channels (e.g. AM1 with AM2 and FM1 with FM2).

FREQUENCY MODULATION

Deviation

Peak deviation available varies with carrier frequency and noise mode selected as follows:

<table>
<thead>
<tr>
<th>Carrier Frequency Range</th>

</tbody>
</table>

*Maximum FM deviation available is 1% of carrier frequency value when in normal noise mode.

Selection

By keyboard entry of data. Variation by UP/DOWN keys and by rotary control.

Indication

3 digits with annunciators.

Displayed Resolution

1 Hz or 1 least significant digit, whichever is greater.

Accuracy at 1 kHz

In low noise modes:
±6% of indication ±1 Hz excluding residual FM.

In normal mode:
±5% of indication ±10 Hz excluding residual FM.

Bandwidth (1 dB)

DC to 300 kHz (DC coupled).
10 Hz to 300 kHz (AC coupled).

Bandwidth is limited to 100 kHz in low noise modes.

Input is capable of accepting external sources of FSK signals. Typical 3 dB bandwidth in normal mode is greater than 1 MHz.
Group delay
Less than 1 µs from 3 kHz to 500 kHz in normal mode.
Less than 3 µs from 3 kHz to 250 kHz in low noise modes.
Carrier Frequency Offset
In DC FM mode less than ±(1 Hz +0.1% of set deviation) after using 
DC FM nulling facility.
Distortion
Using external modulation without ALC:
Less than 3% at maximum deviation for modulation frequencies up to 
20 kHz.
Less than 0.3% at 10% of maximum deviation for modulation frequen-
cies up to 20 kHz.
Modulation Source
Internal LF generator or external via front panel sockets.

WIDEBAND FM

Deviation
As FM.
Indication
3 digits with annunciators.
Selection
By keyboard entry of data. The sensitivity is controlled in 3 dB steps 
and the display will indicate the value of deviation nearest to the 
requested value.
Input level
1 V RMS to achieve indicated deviation.
Accuracy
As FM.
3 dB Bandwidth
In normal noise mode typically 10 MHz (DC or AC coupled).  
In low noise modes typically 250 kHz 
(DC or AC coupled).
Group delay
Less than 0.5 µs from 3 kHz to 10 MHz in normal modes.
Modulation Source
External via rear panel socket (50 Ω impedance).

PHASE MODULATION
(Normal mode only)

Deviation
0 to 10 radians.
Selection
By keyboard entry of data. Variation by UP/DOWN keys and by rotary 
control.
Indication
3 digits with annunciators.
Resolution
0.01 radians.

Accuracy at 1 kHz
±5% of indicated deviation excluding residual phase modulation.

3 dB Bandwidth
100 Hz to 10 kHz.

Distortion
Less than 3% at maximum deviation at 1 kHz modulation rate.

Modulation Source
Internal LF generator or external via front panel sockets.

AMPLITUDE MODULATION

For Carrier Frequencies up to 1 GHz:
Range
0 to 99.9%.
Selection
By keyboard entry of data. Variation by up/down keys and by rotary 
control.
Indication
3 digits with annunciator.
Resolution
0.1%.
Accuracy
±4% of setting +1%.

1 dB Bandwidth
In normal and low noise mode 2:
With Modulation ALC off; DC to 30 kHz in DC coupled mode and  
10 Hz to 30 kHz in AC coupled mode.
Typical modulation bandwidth exceeds 50 kHz.
In low noise mode 1:
With Modulation ALC off; Useable from DC to 1.5 kHz in DC coupled 
mode and 10 Hz to 1.5 kHz in AC coupled mode.
Distortion
For a modulation rate of 1 kHz:
Less than 1% total harmonic distortion for depths up to 30%.
Less than 3% total harmonic distortion for depths up to 80%.
Modulation Source
Internal LF generator or external via front panel sockets.

MODULATION OSCILLATOR

Frequency Range
0.1 Hz to 500 kHz.
Selection
By keyboard entry of data. Variation by UP/DOWN keys and by rotary 
control.
Indication
7 digits with annunciators.
Resolution
0.1 Hz.
Frequency Accuracy
As frequency standard.

Distortion
Less than 0.1% THD in sine wave mode at frequencies up to 20 kHz.

Alternative Waveform
A triangular wave is available for frequencies up to 100 kHz and a square wave up to 2 kHz.

Signaling Tones
The modulation oscillator can be used to generate sub-audible or sequential (up to 16 tones) signaling tones in accordance with EIA, ZVEI, CCIR, EURO 1, EEA, NATAL and DTMF* standards. Facilities are also available for creating and storing user defined tone systems.

* Requires second modulation oscillator (Option 001) to be fitted.

EXTERNAL MODULATION
Two independent inputs on the front panel with BNC connectors, EXT MOD 1 and EXT MOD 2. The modulation is calibrated with 1 V RMS sine wave applied. Input impedance 100 kΩ nominal.

MODULATION ALC
The EXT MOD 1 and EXT MOD 2 modulation inputs can each be levelled by an ALC system.

Level Range
0.7 V RMS to 1.4 V RMS sine wave.

Distortion
Less than 0.1% additional distortion for frequencies up to 20 kHz (typically less than 0.1% up to 50 kHz).

1 dB Bandwidth
Typically 10 Hz to 500 kHz.

LF OUTPUT
Front panel BNC connector. The output may be configured in the LF Generator Mode to give an output from the internal modulation oscillator and in the LF Monitor Mode to give an output from the internal modulation signal paths.

Selection
By keyboard entry of data. Variation by UP/DOWN keys and by rotary control.

Indication
7 digits with unit annunciators for frequency and 4 digits with unit annunciators for level.

Level
100 µV to 5 V RMS with a load impedance of greater than 600 Ω.
100 µV to 1.4 V RMS with a load impedance of greater than 50 Ω.

Common mode voltage
±0.5 V maximum.

Source impedance
5.6 Ω nominal.

Level Accuracy at 1 kHz
With a load impedance of greater than 10 kΩ:
+5% for levels above 50 mV and ±10% for levels from 500 µV to 50 mV.

Frequency Response
Typically better than ±1 dB from 0.1 Hz to 300 kHz.

SWEEP
Not available in low noise mode.

Control Modes
Start/stop values of selected parameter.
Number of steps.
Time per step.

Step Time
1 ms to 10 s per step.

Sweep Ramp
Synchronized analog ramp with an amplitude of nominally 0 to 10 V peak on rear panel BNC connector.

Markers
Five user selectable markers for frequency or level provide an indication when specified parameter values have been reached. Output 0 V to +5 V from 600 Ω on rear panel BNC socket.

Trigger
Rear panel BNC connector. Applying 0 V or a switch closure starts the sweep or steps from point to point on the sweep. Socket is internally connected via 10 kΩ pull-up resistor to +5 V.

FREQUENCY STANDARD (OCXO)

Frequency
10 MHz.

Temperature Stability
Better than ±5 in 10° over the operating range of 0 to 50°C.

Warm up time
Within 2 in 10° of final frequency within 10 minutes from switch on at 20°C ambient.

Ageing Rate
Better than 2 in 10° per year.

Output
Rear panel BNC socket provides an output at frequencies of 1, 5 or 10 MHz with a nominal 2 V pk-pk level into 50 Ω.

External input
Rear panel BNC socket accepts an input at 1, 5 or 10 MHz with an input level in the range 220 mV to 1.8 V RMS into 1 kΩ.

GENERAL

GPIB INTERFACE
A GPIB interface designed in accordance with IEEE 488.2 is fitted as standard.

Capabilities
Complies with the following subsets as defined in IEEE Std.488.1. SH1, AH1, T6, L4, SR1, RL1, P0, DC1, DT1, CO, E2.

ELECTROMAGNETIC COMPATIBILITY
89/336/EEC. Conforms with the limits specified in the following standards:
IEC/EN61326-1 : 1997, RF Emission Class B, Immunity Table 1,
Performance Criteria B

SAFETY
(as amended) and the product safety standard IEC / EN 61010-1 : 2001 + C1 : 2002 + C2 : 2003 for class 1 portable equipment, for
use in a Pollution Degree 2 environment. The instrument is designed
to be operated from an Installation Category 2 supply.

RATED RANGE OF USE
(Over which full specification is met)
Temperature
0 to 55°C.
Humidity
Up to 93% at 40°C.

CONDITIONS OF STORAGE AND TRANSPORT
Temperature
-40 to +71°C.
Humidity
Up to 93% relative humidity at 40°C.
Altitude
Up to 4600 m (15,000 ft).

POWER REQUIREMENTS
AC supply
Four voltage settings covering:
100 V~ (Limit 90 - 115 V~)
120 V~ (Limit 105 - 132 V~)
220 V~ (Limit 188 - 242 V~)
240 V~ (Limit 216 - 264 V~)
Frequency: 50 - 400 Hz (Limit 45 - 440 Hz) 180 VA max

CALIBRATION INTERVAL
2 years.

DIMENSIONS AND WEIGHT
(Over projections but excluding front panel handles)

OPTIONS

OPTION 1 - SECOND MODULATION OSCILLATOR OPTION
Specification as Modulation Oscillator.

OPTION 2 - PULSE MODULATION OPTION
Modulation Modes
Pulse modulation may be used alone or in conjunction with FM, φM or
Wideband FM.
Rise Time
Less than 25 ns.
Control
0 to +1 V for carrier off, +3.5 to +5 V for carrier on.

ON/OFF Ratio
Better than 70 dB, typically exceeds 80 dB.
Additional level error
Less than ±0.5 dB.
Propagation delay
Typically 80 ns from pulse input to RF pulse output.
Input Impedance
50 Ω nominal.

OPTION 105 - SLOW RISE TIME PULSE MODULATION
Modifies pulse modulation option for a typical rise and fall time of
2 μs.

OPTION 3 - +19 dBm RF OUTPUT LEVEL OPTION
For 2040 model only.

RF Output Range
-144 dBm to +19 dBm. When AM is selected the maximum output
level reduces linearly with AM depth to +13 dBm at maximum AM
depth. Overrange allows levels up to +25 dBm to be requested.

Harmonics
At RF levels up to +7 dBm: better than –27 dBc.

OPTION 6 - AVIONICS OPTION
See separate sheet.

OPTION 8 - RF PROFILE AND COMPLEX SWEEP
See separate sheet.

OPTION 12 - ELECTRONIC ATTENUATOR
Carrier Frequency Range
250 kHz* to 1.35 GHz (2040),
250 kHz* to 2.7 GHz (2041).
* Useable to 10 kHz
RF Output Range
-138 dBm to +10 dBm. When AM is selected the maximum output
level reduces linearly with AM depth to +4 dBm at maximum AM
depth.
Accuracy
±1.2 dB for output levels > -127 dBm at 22°C ±5°C
Temperature Stability
±0.01 dB/°C
VSWR
<1.5:1 for output levels less than 0 dBm.
Reverse Power Handling
1 W from a source VSWR of up to 5:1.
Amplitude Modulation
Standard specification applies for carrier frequencies above 50 MHz
(Above 100 MHz for Option6)
VERSIONS AND ACCESSORIES

When ordering please quote the full ordering number information.

Ordering Numbers

Versions

2040  10 kHz to 1.35 GHz Signal Generator
2041  10 kHz to 2.7 GHz Signal Generator
2042  10 kHz to 5.4 GHz Signal Generator

Options

Options are factory fitted only and must be specified at the time of ordering.

Option 001  Second internal modulation oscillator.
Option 002  Pulse Modulation.
Option 003  +19 dBm Output Level (2040 only).
Option 006  Avionics (requires Option 001, not with Option 003).
Option 008  RF Profile and Complex Sweep.
Option 012  Electronic attenuator (2040 and 2041 only), not available with option 003.
Option 015  Modifies the pulse modulation option for slower rise and fall time (order with Option 002).
Option 112  External modulation inputs (2) 600 Ω impedance

Supplied with

AC supply lead.
Operating Manual.

Optional Accessories

46880/050  Service manual.
43126/012  RF connector cable, 50 Ω, 1.5 m, BNC.
54311/092  Coaxial adapter N male to BNC female.
59999/163  Precision coaxial adapter N male to SMA female.
54311/095  RF connector cable, 1 m, type N connectors.
43129/189  GPIB Lead assembly.
46883/408  IEEE/IEC Adapter block for GPIB socket.
46884/291  Rack mounting kit (with slides) for rack cabinets with depths from 480 mm to 680 mm.
46884/292  Rack Mounting kit (with slides) for rack cabinets with depths from 680 mm to 840 mm.
46884/541  Rack mounting kit containing front mounting bracket only.
46884/444  Maintenance kit 2030/40 series.
46662/525  Transit case.
54112/164  Soft carry case.
54499/044  DECT filter.
As we are always seeking to improve our products, the information in this document gives only a general indication of the product capacity, performance and suitability, none of which shall form part of any contract. Our passion for performance is defined by three attributes represented by these three icons: solution-minded, performance-driven and customer-focused.
Signal Sources

2050 Series Digital & Vector Signal Generator

Designed to meet the needs of modern digital radio technologies up to 5.4 GHz

- PSK, FSK, QAM, GMSK
- I and Q modulation to 10 MHz (1 dB bw.)
- External digital data input
- Internal PRBS data source
- Excellent accuracy and stability
- Envelope control for RF bursts
- Programmable channel filter characteristics
- Variable data rate control
- NADC, PDC, GSM, TETRA plus others
- Wide band DCFM for fast FSK
- Baseband I & Q outputs
- Electronic attenuator option

Modulation Capability

The 2050 combines comprehensive analog modes, AM, FM, PM and Pulse (optional), with I Q vector modulation. A digital mode using internal DSP (digital signal processing) is provided to convert digital data into complex modulation formats as shown in the following table.

<table>
<thead>
<tr>

Two FM modes are available, wideband FM (>10 MHz) for fast FSK or video applications and a 1 MHz bandwidth mode. Both modes offer FM deviations up to 1% of carrier frequency. FM is available as either DC or AC coupled. A patented FM nulling correction system eliminates carrier frequency offsets that occur with lesser generators when using DCFM, and allows the 2050 to be used confidently with Wireless LAN or paging equipment such as POCSAG, FLEX™ and ERMES.

Vector Modulation

In Vector mode the signal generator accepts I and Q modulation inputs with 10 MHz, 1 dB bandwidth. This precision modulator enables any modulation characteristic to be simulated with a high degree of accuracy, typical vector errors of less than 0.5% are possible. The excellent temperature stability and drift characteristics of the modulator ensure calibrated signals are always available making this the ideal choice for demanding research and development applications as well as in manufacturing of digital communications systems.
The wide IQ bandwidth allows the generation of Direct Sequence Spread Spectrum signals as used in CDMA as well as QAM and OFDM signals as used in new broadcasting formats such as DAB (Digital Audio Broadcast).

Precision radar Chirp signals can be simulated in conjunction with an Arbitrary Waveform Generator to test radar receivers.

**Digital Modulation**

In digital mode, the signal generator is able to produce a wide array of digital modulation types and in each case the user is free to modify the data rate and filter characteristics to suit individual application needs. This level of control and flexibility means that the 2050 series is fully prepared today for the digital formats of tomorrow’s narrow band digital radio communications equipment.

For common standards, the 2050 is already pre-programmed to generate the required modulation format from a single key press and so aid ease of use. Proprietary schemes can be created and stored into non volatile user memories.

Data rates up to 34 ksymbs/sec can either be generated internally from a pseudo random sequence generator or supplied externally as a serial or parallel data stream into a flexible digital interface. A burst control input allows TDMA or TDD bursts to be generated synchronously with the data. A separate analog envelope control input allows linear control of the RF level to simulate bursted modulation conforming to power time template and adjacent channel spectrum requirements.

In digital mode the user can introduce defined errors to the modulation as skew, gain imbalance and carrier leakage, and so aid investigation of design limitations.

**Fading Simulation**

The built-in Rician and Rayleigh fading simulator with programmable path ratio and Doppler speed allows testing of receivers under ‘real life’ propagation conditions in which receivers must operate. The availability of fading simulation at the early design stages of new communications equipment simplifies the development of more robust designs and reduces the time taken for full compliance testing.

**Software Assisted Calibration**

All calibration and re-alignment procedures can be carried out without removal of the instrument covers and can be performed either manually or automatically via the GPIB. No internal adjustments are necessary; even the frequency standard is adjusted via the front panel or GPIB. During manual alignment full instructions are given on the instrument display. In digital and vector modes a self calibration system optimizes the performance of the vector modulator; a warning is displayed when environmental changes or elapsed time warrant a recalibration of the modulator.

**Electronic Attenuator**

An electronic attenuator option is available to meet demanding extended life requirements for repetitive switching, found in high volume production applications.

**SPECIFICATION**

**GENERAL DESCRIPTION**

2050 series signal generators have a large screen dot matrix display with softkey function selection which allows flexibility of operation. Hardkey and data entry key together with a rotary control knob are also provided. The output may be modulated using ΦM, FM, AM, IQ vector or complex digital modulation. Pulse modulation is optional.

**CARRIER FREQUENCY**

**Range**
- 10 kHz to 1.35 GHz (2050)
- 10 kHz to 2.7 GHz (2051)
- 10 kHz to 5.4 GHz (2052)

In digital and vector modes the lowest frequency is 10 MHz and for 2052 the highest frequency is reduced to 2.7 GHz.

**Selection**
- By keyboard entry of data. Variation by up/down keys and by rotary control.

**Indication**
- 11 digits with annunciators.

**Resolution**
- 0.1 Hz.

**Accuracy**
- As frequency standard.

**Phase incrementing**
- The carrier phase can be advanced or retarded in steps of 1.5° using the rotary control.

**RF OUTPUT**

**Range (Analog mode)**
- –144 dBm to +13 dBm
- Max guaranteed output above 2.7 GHz is +11 dBm.

With AM selected, the maximum output level reduces linearly with AM depth to +7 dBm at maximum AM depth.

**Range (Digital or Vector mode)**
- –138 to +6 dBm peak envelope power.
- RF level is defined with a PRBS modulation applied in digital mode or with 0.5 V applied to either the I or Q input in vector mode.
**Selectable Overrange Mode**
Uncalibrated levels up to +19 dBm.

**Selectable Extended Hysterisis**
Uncalibrated RF level control over a range of 24 dB (maximum) without level interruption.

**Selection**
By keyboard entry of data. Variation by $\uparrow$ $\downarrow$ keys and by rotary control.

**Units may be $\mu$V, mV, V, EMF or PD; dB relative to 1 $\mu$V, 1 mV, EMF or PD; dBm.**

**Indication**
4 digits with unit annunciators.

**Resolution**
0.1 dB.

**Accuracy**

</tr>
<tr>
<td>2052</td>
<td>&lt;30 dBC</td>
<td>&lt;27 dBC</td>
<td>&lt;25 dBC</td>
</tr>
</tbody>
</table>

**Sub-Harmonics**
< −90 dBC to 1.35 GHz, < −40 dBC to 2.3 GHz,
< −30 dBC to 5.4 GHz.

**Non-Harmonics**
< −70 dBC at offsets from the carrier frequency of 3 kHz or greater.

**Residual FM**
Less than 7 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 470 MHz.

**SSB phase noise**
Less than –116 dBc/Hz (typically –122 dBc/Hz) at an offset of 20 kHz from a carrier frequency of 470 MHz.

**RF Leakage**
Less than 0.5 $\mu$V PD at the carrier frequency in a two turn 25 mm loop, 25 mm or more from any part of the case.

**FM on AM**
Typically less than 100 Hz for 30% AM depth at a modulation frequency of 1 kHz and a carrier frequency of 500 MHz.

**ΦM on AM**
Typically less than 0.1 radians at a carrier frequency of 500 MHz for 30% AM depth for modulation rates up to 10 kHz.

In digital and vector modes of operation:
Modulation is generated by converting a 120 MHz, 132 MHz, 160 MHz or 176 MHz intermediate frequency (IF) to the required carrier frequency.

Additional signals are present at the local oscillator frequency, image frequencies and frequencies equivalent to the harmonics of the IF mixed with the local oscillator.

**Phase Noise**
In vector mode: As analog modulation and CW modes.
In digital mode: As analog modulation modes for offsets >100 kHz; <-108 dBC/Hz at 20 kHz offset from a 1 GHz carrier.

**Modulation Modes**
Six modulation modes are available:

- Single
  FM, Wideband FM, ΦMW, AM or pulse (optional).

- Dual
  Two independent channels of differing modulation type (e.g. AM with FM).

- Composite
  Two independent channels of the same modulation type (e.g. FM1 with FM2).

- Dual Composite
  A combination of Dual and Composite modes providing four independent channels (e.g. AM1 with AM2 and FM1 with FM2).

- Vector
  Provides IQ modulation facility.

- Digital
  Accepts digital inputs and converts the signal to QAM, PSK, GMSK or FSK formats.

**Frequency Modulation**
Peak deviation from 0 to 1 MHz for carrier frequencies up to 21.09375 MHz. Peak deviation from 0 to 1% of carrier frequency above 21.09375 MHz.

**Selection**
By keyboard entry of data. Variation by $\uparrow$ $\downarrow$ keys and by rotary control.

**Indication**
3 digits with annunciators.

**Displayed Resolution**
1 Hz or 1 least significant digit, whichever is greater.
**Accuracy at 1 kHz**

±5% of indication ±10 Hz excluding residual FM.

**Bandwidth (1 dB)**

DC to 300 kHz (DC coupled).
10 Hz to 300 kHz (AC coupled).

Input is capable of accepting external sources of FSK signals. Typical 3 dB bandwidth is >1 MHz.

**Group delay**

Less than 1 µs from 3 kHz to 500 kHz.

**Carrier Frequency Offset**

In DC FM less than ± (1 Hz + 0.1% of set deviation) after using DC FM nulling facility.

**Distortion**

Using external modulation without ALC: Less than 3% at maximum deviation for modulation frequencies up to 20 kHz. Less than 0.3% at 10% of maximum deviation for modulation frequencies up to 20 kHz.

**Modulation source**

Internal LF generator or external via front panel sockets.

**WIDEBAND FM**

**Deviabtion**

As FM.

**Indication**

3 digits with annunciators.

**Selection**

By keyboard entry of data. The sensitivity is controlled in 3 dB steps and the display will indicate the nearest value of deviation to that requested.

**Input level**

1.414 V peak (1 V RMS sine wave) to achieve indicated deviation.

**Accuracy**

As FM.

**3 dB Bandwidth**

Typically 10 MHz (DC or AC coupled).

**Group Delay**

Less than 0.5 ms from 3 kHz to 10 MHz.

**Modulation Source**

External via rear panel socket (50 Ω impedance).

**PHASE MODULATION**

**Deviabtion**

0 to 10 radians.

**Selection**

By keyboard entry of data. Variation by up/down keys (or ?) and by rotary control.

**Indication**

3 digits with annunciators.

**Resolution**

0.01 radians.

**Accuracy at 1 kHz**

±5% of indicated deviation excluding residual phase modulation.

**3 dB Bandwidth**

100 Hz to 1 kHz.

**Distortion**

Less than 3% at maximum deviation at 1 kHz modulation rate.

**Modulation Source**

Internal LF generator or external via front panel sockets.

**AMPLITUDE MODULATION**

For carrier frequencies up to 1 GHz.

**Range**

0 to 99.9%.

**Selection**

By keyboard entry of data. Variation by up/down keys (or ?) and by rotary control.

**Indication**

3 digits with annunciator.

**Resolution**

0.1%.

**Accuracy**

±4% of setting ±1%.

**1 dB Bandwidth**

With modulation ALC off; DC to 30 kHz in DC coupled mode and 10 Hz to 30 kHz in AC coupled mode.

Typical modulation bandwidth exceeds 50 kHz.

**Distortion**

For a modulation rate of 1 kHz: Less than 1% total harmonic distortion for depths up to 30%, less than 3% total harmonic distortion for depths up to 80%.

**Modulation source**

Internal LF generator or external via rear panel sockets.

**DIGITAL MODULATION**

In digital mode the instrument can be used over the carrier frequency range 10 MHz to 1.35/2.7 GHz and accepts internal or external data to modulate the RF output. The modulation can be applied in common digital formats and the channel filter characteristics specified.

**Internal Data**

All 0’s, 1’s or selectable PN 2 to 7, 9, 10, 11 or 15 PRBS sequence.

Note with GSM selected PRBS is limited to PN9 & 15. All 0’s and all 1’s are available.

**External data**

Accepts data as a serial input or parallel input from a 25 way auxiliary D Type connector on the rear panel. Accepts symbols containing 1 to 8 data bits with internally or externally generated clock sources. All inputs and outputs are TTL/CMOS logic compatible.

Note, in GSM mode, external data must be supplied as 8 bit parallel.
Symbol Rate

<table>
<thead>

</tr>
</tbody>
</table>

Symbol source can be internal or external, internal symbol rate is adjustable in steps of 0.1 symbols/s. Symbol rate must be within 2% of external symbol rate to maintain modulation accuracy.

Generic Modulation types

Can select PSK, Differential PSK, Differential Phase Offset PSK (i.e \(\pi/4\)DQPSK), Time Offset QPSK, QAM, GMSK and FSK. The number of bits per symbol can be selected from 2 to 8 for QAM, 1 to 3 for PSK and 1 or 2 for FSK systems.

RF Channel Filters

Root raised cosine, raised cosine or Gaussian. Filter bandwidth can be selected as follows: Raised cosine or root raised cosine for \(\alpha\) from 0.2 to 0.8 in 0.01 steps. Gaussian 3 dB bandwidth from 0.4 of the symbol rate (0.2 of symbol rate as IQ baseband filter) up to a maximum of 22.6 kHz.

Pre-defined Modulation Types

The following can be selected:

<table>

</tr>
</tbody>
</table>

Modulation Accuracy

At the decision points with the envelope input at 1 V or disabled and filter above 0.25 for raised cosine filters and 0.3 for root raised cosine filters:

- PSK & QAM: \(<1.5\%\) RMS vector error
- NADC, PDC: \(<1\%\) RMS vector error (EIA, RCR 27A method)
- GSM & CDPD: \(<3\%\) RMS phase error (typical)

FSK/GMSK

Frequency deviation can be set with 1 Hz resolution across the range 100 Hz to 20 kHz.

Accuracy: \(<1\%\) of set deviation.

Modulation errors

- Modulation errors can be added to simulate:
  - IQ skew from 0 to \(\pm 20^\circ\) in 0.1° steps
  - IQ imbalance from 0 to \(\pm 10\) dB in 0.1 dB steps
  - Carrier leak from 0 to 10% in 0.1% steps
- Range of errors allowed is limited by the peak envelope power.
- Note: modulation errors are not available in either GSM or OQPSK modes.

IQ Outputs

Baseband IQ output signals available on the front panel at a level of 0.5 V p.d. nominal into 50 \(\Omega\).

Burst control

Available on the rear panel D Type connector. A logic 1 on the burst control turns the RF on over a time interval corresponding to 3 data symbols. Propagation delay is matched to the data path delay. Can be used with the Envelope input.

Burst control is not available with GMSK and FSK modulation types.

ON/OFF Ratio

Greater than 80 dB.

VECTOR MODULATION

Provides for IQ modulation of the carrier output from an external source for carrier frequencies of 10 MHz to 1.35/2.7 GHz.

Carrier Leakage and SSB Image Rejection

Following self-calibration, the RF carrier leakage and SSB image rejection are typically 50 dB.

Vector inputs

IQ inputs on the front panel. The RF level requested is obtained with 0.5 V DC applied to one of the inputs. Input impedance is selectable between 50 \(\Omega\) and 300 \(\Omega\).

DC Vector accuracy

- For carrier frequencies up to 2 GHz: \(\pm 1\%\) amplitude of FS.
- \(\pm 1^\circ\) at FS.
- For carrier frequencies above 2 GHz: \(\pm 1.5\%\) amplitude of FS.
- \(\pm 1.5^\circ\) at FS.

Vector bandwidth

- \(\pm 0.5\) dB wrt DC for modulation frequencies up to 3 MHz.
- \(\pm 1\) dB wrt DC for modulation frequencies up to 10 MHz and carrier frequencies up to 2 GHz.
- \(\pm 1.3\) dB wrt DC for carrier frequencies up to 2.7 GHz.

IQ MODULATION CALIBRATION

The signal generator can calibrate the IQ modulator automatically. After a 0.5 hour warm up period the calibration remains valid for at least 3 hours over a temperature range of \(\pm 5^\circ\)C. The instrument displays a warning if the calibration validity time or temperature range has been exceeded. Calibration is valid for both digital and vector modes.

FADING SIMULATION

Rayleigh and Rician fading can be simulated in both Vector and Digital modulation modes. Doppler speed can be entered from 0 to 200 Hz with a maximum ratio of 2:1 between direct and scattered speed. Path ratio can be set to \(\pm 50\) dB.

Note: Fading is not available in either GSM or OQPSK modes.

ENVELOPE CONTROL

The RF level can be varied by applying a control voltage to the envelope input in digital and vector modes. The input may be used to shape the rise and fall of an RF burst and simulate the effect of varying RF levels being received from mobiles in TDMA systems. Applying 1 V gives the set RF level and 0 V suppresses the carrier.

Linear range

Greater than 30 dB.

Linearity typically better than 0.5 dB at \(-20\) dBV (100 mV input).
ON/OFF ratio
Greater than 80 dB.

Envelope delay
< 10 µs, typically 6 µs.

Rise/fall time
Less than 13 µs to –70 dBc.

IF OUTPUT
An IF output is available on the rear panel which is modulated by the selected digital or vector modulation. The IF output can be inhibited by software control. The IF output can be used to provide modulated carriers at higher frequencies by external frequency conversion. The RF output from the front panel connector can be used as an LO for external frequency conversion.

MODELLING OSCILLATOR
Frequency range
0.1 Hz to 500 kHz.

Selection
By keyboard entry of data. Variation by † ‡ keys and by rotary control.

Indication
7 digits with annunciators.

Resolution
0.1 Hz.

Frequency accuracy
As frequency standard.

Distortion
Less than 0.1% THD in sine wave mode at frequencies up to 20 kHz.

Alternative waveform
A triangular wave is available in addition to the sine wave for frequencies up to 100 kHz.

Modulation oscillator can be used to generate sequential (up to 16 tones) or sub-audible signalling tones in accordance with EIA, ZVEI, DZVEI, CCIR, EURO 1, EEA, NATAL and DTMF* standards.

Facilities are also available for creating and storing user defined tone systems.
*A requires second modulation oscillator (option 001) to be fitted.

EXTERNAL MODULATION
Two independent inputs on the front panel with BNC connectors, EXT MOD 1 and EXT MOD 2. The modulation is calibrated with 1.414 V peak (1 V RMS sine wave) applied. Input impedance 100 kΩ nominal.

MODULATION ALC
The EXT MOD 1 and EXT MOD 2 modulation inputs can be levelled by an ALC system.

Level Range
1 V to 2 V peak (0.7 to 1.4 V RMS sine wave).

Distortion
Less than 0.1% additional distortion for frequencies up to 20 kHz (typically less than 0.1% up to 50 kHz).

1 dB Bandwidth
Typically 10 Hz to 500 kHz.

LF OUTPUT
Front panel BNC connector. The output may be configured in the LF Generator Mode to give an output from the internal modulation oscillator and in the LF Monitor Mode to give an output from the internal modulation signal paths.

Selection
By keyboard entry of data.

Variation by † ‡ keys and by rotary control.

Indication
7 digits with unit annunciators for frequency and 4 digits with unit annunciators for level.

Level
100 µV to 5 V RMS with a load impedance of greater than 600 Ω. 100 µV to 1.4 V RMS with a load impedance of greater than 50 Ω.

Source impedance
5.6 Ω nominal.

Level accuracy at 1 kHz
With a load impedance of greater than 10 kW: LF ±5% for levels above 50 mV LF ±10% for levels from 500 µV to 50 mV.

Frequency Response
Typically <±1 dB from 0.1 Hz to 300 kHz.

SWEEP
Control modes
Start/stop values of selected parameter. Number of steps. Time per step.

Step time
1 ms to 20 s per step.

Sweep ramp
Synchronized analog ramp with a nominal amplitude of 0 to 10 V peak on rear panel BNC connector.

Markers
User selectable markers for frequency or level provide an indication when specified parameter values have been reached. Output 0 V to +5 V from 600 Ω on rear panel BNC socket.

Trigger
Rear panel BNC connector. Applying 0 V or a switch closure starts the sweep. Connector is internally connected via 10 kΩ pull-up resistor to +5 V.

FREQUENCY STANDARD (OCXO)
Frequency
10 MHz.

Temperature stability
Better than ±5 in 10⁸ in the operating range of 0 to 50°C.

Warm up time
Within 2 in 10⁷ final frequency within 10 minutes from switch on at 20°C ambient.

Ageing rate
Better than 2 in 10¹ per year.

Output
Rear panel BNC socket provides an output at frequencies of 1, 5 or 10 MHz with a nominal 2 V pk-pk level into 50 Ω. Output can be dis-
External input

Rear panel BNC socket accepts an input at 1, 5 or 10 MHz with an input level in the range 220 mV to 1.8 V RMS into 1 kΩ.

General

GPIB Interface

A GPIB interface is fitted. All functions except the supply switch and display contrast are remotely programmable.

Capabilities

Designed in accordance with IEEE488.2. Complies with the following subsets as defined in IEEE Std. 488.1: SH1, AH1, T6, L4, SR1, RLI, PP0, DC1, DT1, CO, E2.

Electromagnetic Compatibility

Conforms with the protection requirements of the EEC Council Directive 89/336/EEC. Conforms with the limits specified in the following standards:

IEC/EN61326-1:1997, RF Emission Class B, Immunity Table 1, Performance Criteria B

Safety

Conforms with the requirements of EEC Council Directive 73/23 EEC (as amended) and the product safety standard IEC / EN 61010-1:2001 + C1:2002 + C2:2003 for class 1 portable equipment, for use in a Pollution Degree 2 environment. The instrument is designed to be operated from an Installation Category 2 supply.

Rated Range of Use (Over which full specification is met)

Temperature

0 to 55°C.

Humidity

Up to 93% at 40°C.

Conditions of Storage and Transport

Temperature

-40°C to +71°C.

Humidity

Up to 93% relative humidity at 40°C.

Altitude

Up to 4600 m (15,000 ft).

Power Requirements

AC Supply

Four voltage settings covering:

100 V~ (Limit 90 - 115 V~)
120 V~ (Limit 105 - 132 V~)
220 V~ (Limit 188 - 242 V~)
240 V~ (Limit 216 - 264 V~)

Frequency: 50 - 400 Hz (Limit 45 - 440 Hz) 180 VA max

Calibration Interval

2 years.

Dimensions and Weight

(Over projections but excluding handles)

Height

152 mm

Width

425 mm

Depth

525 mm

Weight

21 kg

Options

Option 1 - Second Modulation Oscillator Option

Specification as Modulation Oscillator.

Option 2 - Pulse Modulation Option

Modulation Modes

Pulse modulation may be used alone or in conjunction with ΦM, FM, Wideband FM, Vector or Digital Modulation.

Rise/Fall Time

25 ns.

Control

0 V for carrier off, +5 V for carrier on. Threshold level is typically +2.5 V.

On/Off Ratio

Better than 70 dB. Input impedance 50 Ω.

Option 105 - Slow Rise Time Pulse Modulation

Modifies pulse modulation option for a typical rise and fall time of 1 µs.

Option 6 - Avionics Option

See separate sheet.

Option 8 - RF Profile and Complex Sweep

See separate sheet.

Option 12 - Electronic Attenuator

Carrier Frequency Range

250 kHz* to 1.35 GHz (2050).
250 kHz* to 2.7 GHz (2051).

* Useable to 10 kHz (50 MHz in Digital or Vector modes, useable to 10 MHz)

RF Output

Range (Analog mode)

-138 dBm to +10 dBm When AM is selected the maximum output level reduces linearly with AM depth to +4 dBm at maximum AM depth.

Range (Digital or Vector mode)

-132 dBm to +3 dBm peak envelope power.

Accuracy

±1.2 dB in non Digital or Vector modes for output levels > -127 dBm at 22°C ±5°C

Temperature Stability

±0.01 dB/°C

VSWR

< 1.5:1 for output levels less than 0 dBm.

Reverse Power Handling

1 W from a source VSWR of up to 5:1.

Amplitude Modulation

Standard specification applies for carrier frequencies above 50 MHz (Above 100 MHz for Option 6).

Optional Accessories

- 44991/144 Break out box. Converts auxiliary D type -connector to 8 data, I burst line, and a it/symbol clocks on BNC connectors. Daisy chain connection allows the monitoring of the signals (on BNC connectors).
- 43126/012 RF connector cable, 50 Ω, 1.5 m, BNC
- 54311/092 Coaxial adapter N male to BNC female
- 59999/163 Precision coaxial adapter N male to SMA female
- 54311/095 RF connector cable, 1 m, type N connectors
- 43129/189 GPIB Lead assembly
- 46883/408 IEEE/IEC Adapter block for GPIB socket
- 46884/291 Rack mounting kit (with slides) for rack cabinets with depths from 480 mm to 680 mm
- 46884/292 Rack mounting kit (with slides) for rack cabinets with depths from 680 mm to 840 mm
- 46884/541 Rack mounting kit containing front mounting brackets only
- 46884/444 Maintenance kit 2030/40/50 series
- 46662/525 Transit case
- 54112/164 Soft carry case
- 54499/044 DECT Filter
- 46880/062 Service manual
Signal Sources
2050T Series Signal Generators

Setting the standard for low adjacent channel power for TETRA modulation

- <70 dBc Adjacent Channel Power TETRA modulation
- Excellent vector accuracy
- Rayleigh & Rician fading
- Burst control
- Internal PRBS data source
- Baseband IQ outputs
- IQ vector modulation

The new 2050T series are variants of the successful 2050 series of digital and vector signal generators. They have been designed to satisfy the challenging needs of TETRA radio development and production but without compromising any of the 2050's original features.

Adjacent Channel Power
For TETRA radio development and production, a new level of signal generator performance is demanded. For selectivity testing of TETRA radio receivers, the level of adjacent channel power from the interfering source (TETRA T2) must be lower than -70 dBc.

Throughout all areas of TETRA development, the problem of adjacent channel power is a key issue which the 2050T series have been specifically designed to address. The 2050T series offer better than -70 dBc adjacent channel power across the RF frequency range 100 MHz to 490 MHz and throughout their RF level range whilst maintaining a RMS vector error of better than 1.5%.

TETRA Modulation
The modulation characteristics of TETRA are faithfully reproduced within the 2050T series. \( \pi/4 \) Differential QPSK is only one of many modulation types provided. In Advanced Digital Mode the modulation parameters are fixed to those demanded by TETRA. In Normal Digital Mode it is possible to modify subtle aspects of the modulation such as filter alpha coefficients or modulation data rates.

Rayleigh and Rician Fading
It is easy to introduce Rayleigh or Rician fading together with modulation impairments, such as IQ imbalance, skew and carrier leakage to each of the baseband, IF and RF outputs.

Burst Control
The TDMA characteristics of TETRA can be readily simulated. Using the 2050T series Envelope Control, bursts of modulation with...
over 80 dB dynamic range are possible. The Envelope Control features a linear modulator allowing careful definition of burst ramps. Alternatively if the 2050T series are used with an external data source, RF bursts may be defined digitally by a simple TTL or CMOS control which produces controlled ramp profiles.

**Digital Data Source**
The 2050T series feature an internal data generator able to produce various PRBS sequences as per CCITT V.52 recommendations. Alternatively, it is possible to input serial or parallel TTL/CMOS data sequences in real time from an external data source. External data may be clocked in using Bit and Symbol clocks supplied internally from the 2050T series or from external sources.

**IQ Outputs**
The 2050T series feature an IQ vector modulator which may be driven from external I and Q analog drives or from internally DSP generated signals. The internally generated I and Q filtered signals, together with any fading and selected impairments, are available as I and Q analog outputs. They may then be used to drive external modulators or used as test signals in cartesian feedback designs.

**Electronic Attenuator**
An electronic attenuator option is available to meet demanding extended life requirements for repetitive switching, found in high volume production applications.

---

**SPECIFICATION**

**GENERAL DESCRIPTION**

2050T series signal generators have a large screen dot matrix display with softkey function selection which allows flexibility of operation. Hardkey and data entry key together with a rotary control knob are also provided. The output may be modulated using ΦM, FM, AM, IQ vector or complex digital modulation. Pulse modulation is optional.

**CARRIER FREQUENCY**

**Range**
- 10 kHz to 1.35 GHz (2050T)
- 10 kHz to 2.7 GHz (2051T)
- 10 kHz to 5.4 GHz (2052T)

In digital and vector modes the lowest frequency is 10 MHz and for 2052T the highest frequency is reduced to 2.7 GHz.

**Selection**
By keyboard entry of data. Variation by up/down keys and by rotary control.

**Indication**
11 digits with annunciators.

**Resolution**
0.1 Hz.

**Accuracy**
As frequency standard.

**Phase incrementing**
The carrier phase can be advanced or retarded in steps of 1.5° using the rotary control.

---

**RF OUTPUT**

**Range (Analog mode)**
- –144 dBm to +13 dBm. Max guaranteed output above 2.7 GHz is +11 dBm.

With AM selected, the maximum output level reduces linearly with AM depth to +7 dBm at maximum AM depth.

**Range (Digital or Vector mode)**
- –138 to +6 dBm* peak envelope power.

RF level is defined with a PRBS modulation applied in digital mode or with 0.5 V applied to either the I or Q input in vector mode.

*Maximum level is reduced to -6 dBm PEP when in advanced digital mode

**Selectable Overrange Mode**
Uncalibrated levels up to +19 dBm in analog mode.

**Selectable Extended Hysterisis**
Uncalibrated RF level control over a range of 24 dB (maximum) without level interruption.

**Selection**
By keyboard entry of data. Variation by 9 & keys and by rotary control. Units may be μV, mV, V, EMF or PD; dB relative to 1 μV, 1 mV, EMF or PD; dBm.

**Indication**
4 digits with unit annunciators.

**Resolution**
0.1 dB.

**Accuracy**
At 22°C ±5°C in non Digital or Vector modes:
- <1.35 GHz <2.7 GHz <5.4 GHz
- >0 dBm ±0.5 dB ±0.7 dB ±1 dB
- >–50 dBm ±0.85 dB ±1 dB ±1.5 dB
- >–127 dBm ±0.85 dB ±1 dB –

Temperature stability dB/°C 0.005 0.01 0.02

In Digital or Vector Mode:
At a temperature of 22°C ±5°C
- <2 GHz ±1.5 dB
- <2.7 GHz ±2 dB

Temperature coefficient : < 0.04 dB/°C

**VSWR**
For output levels less than 0 dBm:
- <2.2 GHz <1.25:1 (19.1 dB return loss)
- <2.7 GHz <1.4:1 (15.6 dB return loss)
- <5.4 GHz <1.5:1 (14 dB return loss)

**Output Protection**
Reverse power of 50 W from a source VSWR of upto 5:1
SPECTRAL PURITY (ANALOG MODE)

At RF levels up to +7 dBm in CW and analog modulation modes:

<table>
<thead>
<tr>
<th>Harmonics</th>
<th>≤1 GHz</th>
<th>1 GHz to &gt;1.35 GHz</th>

<tr>
<td>2052T</td>
<td>&lt; -30 dBc</td>
<td>&lt; -27 dBc</td>
</tr>
</tbody>
</table>

Sub-harmonics

< -90 dBc to 1.35 GHz, < -40 dBc to 2.3 GHz, < -30 dBc to 5.4 GHz.

Non-harmonics

< -70 dBc at offsets from the carrier frequency of 3 kHz or greater.

Residual FM

Less than 7 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 470 MHz.

SSB phase noise

Less than −116 dBc/Hz (typically −122 dBc/Hz) at an offset of 20 kHz from a carrier frequency of 470 MHz.

RF Leakage

Less than 0.5 µV PD at the carrier frequency in a two turn 25 mm loop, 25 mm or more from any part of the case.

FM on AM

Typically less than 100 Hz for 30% AM depth at a modulation frequency of 1 kHz and a carrier frequency of 500 MHz.

ΦM on AM

Typically less than 0.1 radians at a carrier frequency of 500 MHz for 30% AM depth for modulation rates up to 10 kHz.

SPECTRAL PURITY (DIGITAL AND VECTOR MODES)

Modulation is generated by converting a 120 MHz, 132 MHz, 160 MHz or 176 MHz intermediate frequency (IF) to the required carrier frequency.

Additional signals are present at the local oscillator frequency, image frequency and frequencies equivalent to the harmonics of the IF mixed with the local oscillator.

Phase noise

In vector mode: As analog modulation and CW modes.

In digital mode: As analog modulation modes for offsets >100 kHz; < −108 dBc/Hz at 20 kHz offset from a 1 Hz carrier.

MODULATION MODES

Seven modulation modes are available:

Single

FM, Wideband FM, ΦM, AM or pulse (optional).

Dual

Two independent channels of differing modulation type (e.g. AM with FM).

Composite

Two independent channels of the same modulation type (e.g. FM1 with FM2).

Dual composite

A combination of Dual and Composite modes providing four independent channels (e.g. AM1 with AM2 and FM1 with FM2).

Vector

Provides IQ modulation facility.

Digital

Accepts digital inputs and converts the signal to QAM, PSK, GMSK or FSK formats.

Advanced Digital

Accepts digital inputs and converts the signal to accurate TETRA modulation with low levels of adjacent channel power.

FREQUENCY MODULATION

Deviation

Peak deviation from 0 to 1 MHz for carrier frequencies up to 21.09375 MHz. Peak deviation from 0 to 1% of carrier frequency above 21.09375 MHz.

Selection

By keyboard entry of data. Variation by +/− keys and by rotary control.

Indication

3 digits with annunciators.

Displayed Resolution

1 Hz or 1 least significant digit, whichever is greater.

Accuracy at 1 kHz

±0.5% of indication ±10 Hz excluding residual FM.

Bandwidth (1 dB)

DC to 300 kHz (DC coupled).

10 Hz to 300 kHz (AC coupled).

Input is capable of accepting external sources of FSK signals. Typical 3 dB bandwidth is >1 MHz.

Group delay

Less than 1 µs from 3 kHz to 500 kHz.

Carrier Frequency Offset

In DC FM less than ± (1 Hz + 0.1% of set deviation) after using DC FM nulling facility.

Distortion

Using external modulation without ALC: Less than 3% at maximum deviation for modulation frequencies up to 20 kHz. Less than 0.3% at 10% of maximum deviation for modulation frequencies up to 20 kHz.

Modulation source

Internal LF generator or external via front panel sockets.

WIDEBAND FM

Deviation

As FM.

Indication

3 digits with annunciators.

Selection

By keyboard entry of data. The sensitivity is controlled in 3 dB steps and the display will indicate the nearest value of deviation to that requested.
**Input level**

1.414 V peak (1 V RMS sine wave) to achieve indicated deviation.

**Accuracy**

As FM.

**3 dB Bandwidth**

Typically 10 MHz (DC or AC coupled).

**Group Delay**

Less than 0.5 µs from 3 kHz to 10 MHz.

**Modulation Source**

External via rear panel socket (50 Ω impedance).

**PHASE MODULATION**

- **Deviation**
  0 to 10 radians.
- **Selection**
  By keyboard entry of data. Variation by up/down keys (or 0 0) and by rotary control.
- **Indication**
  3 digits with annunciators.
- **Resolution**
  0.01 radians.
- **Accuracy at 1 kHz**
  ±5% of indicated deviation excluding residual phase modulation.

**3 dB Bandwidth**

100 Hz to 10 kHz.

**Distortion**

Less than 3% at maximum deviation at 1 kHz modulation rate.

**Modulation Source**

Internal LF generator or external via front panel sockets.

**AMPLITUDE MODULATION**

For carrier frequencies up to 1 GHz.

- **Range**
  0 to 99.9%.
- **Selection**
  By keyboard entry of data. Variation by up/down keys (or 0 0) and by rotary control.
- **Indication**
  3 digits with annunciator.
- **Resolution**
  0.1%.
- **Accuracy**
  ±4% of setting ±1%.

**1 dB Bandwidth**

With modulation ALC off; DC to 30 kHz in DC coupled mode and 10 Hz to 30 kHz in AC coupled mode. Typical modulation bandwidth exceeds 50 kHz.

**Distortion**

For a modulation rate of 1 kHz: Less than 1% total harmonic distortion for depths up to 30%, less than 3% total harmonic distortion for depths up to 80%.

**Modulation Source**

Internal LF generator or external via front panel connectors.

**DIGITAL MODULATION**

In digital mode the instrument can be used over the carrier frequency range 10 MHz to 1.35/2.7 GHz and accepts internal or external data to modulate the RF output. The modulation can be applied in common digital formats and the channel filter characteristics specified.

**Internal Data**

All 0’s, 1’s or selectable PN 2 to 7, 9, 10, 11 or 15 PRBS sequence.

Note with GSM selected PRBS is limited to PN9 & 15. All 0’s and all 1’s are available.

**External data**

Accepts data as a serial input or parallel input from a 25 way auxiliary D Type connector on the rear panel. Accepts symbols containing 1 to 8 data bits with internally or externally generated clock sources. All inputs and outputs are TTL/CMOS logic compatible.

Note, in GSM mode, external data must be supplied as 8 bit parallel.

**Symbol Rate**

<table>
<thead>
<tr>
<th>Mod Type</th>
<th>min sym/s</th>
<th>max sym/s</th>
<th>Filter</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSK, QAM</td>
<td>1900</td>

<td>All filters</td>
</tr>
</tbody>
</table>

Symbol source can be internal or external, internal symbol rate is adjustable in steps of 0.1 symbols/s. Symbol rate must be within 2% of external symbol rate to maintain modulation accuracy.

**Generic Modulation types**

Can select PSK, Differential PSK, Differential Phase Offset PSK (i.e π/4 DQPSK), Time Offset QPSK, QAM, GMSK and FSK. The number of bits per symbol can be selected from 2 to 8 for QAM, 1 to 3 for PSK and 1 or 2 for FSK systems.

**RF Channel Filters**

Root raised cosine, raised cosine or Gaussian. Filter bandwidth can be selected as follows: Raised cosine or root raised cosine for a from 0.2 to 0.8 in 0.01 steps. Gaussian 3 dB bandwidth from 0.4 of the symbol rate (0.2 of symbol rate as IQ baseband filter) up to a maximum of 22.6 kHz.

**Pre-defined Modulation Types**

The following can be selected:

<table>

<td>ERMES, APCO25</td>
</tr>
<tr>
<td>8DPSK</td>
<td>VDR (VDL)</td>
</tr>
</tbody>
</table>
Modulation Accuracy
At the decision points with the envelope input at 1 V or disabled and filter above 0.25 for raised cosine filters and 0.3 for root raised cosine filters:

- PSK & QAM <1.5% RMS vector error
- NADC, PDC <1% RMS vector error (EIA, RCR 27A method)
- GSM & CDPD <3° RMS phase error (typical)

FSK/GMSK
Frequency deviation can be set with 1 Hz resolution across the range 100 Hz to 20 kHz. Accuracy = <1% of set deviation.

Modulation errors
Modulation errors can be added to simulate:
- IQ skew from 0 to ±20° in 0.1° steps
- IQ imbalance from 0 to ±10 dB in 0.1 dB steps
- Carrier leak from 0 to 10% in 0.1% steps

Ranges of errors allowed is limited by the peak envelope power.

Note: modulation errors are not available in either GSM or OQPSK modes.

IQ Outputs
Baseband IQ output signals available on the front panel at a level of 0.5 V p.d. nominal into 50 Ω. Levels are reduced by 12 dB in advanced digital mode.

Burst control
Available on the rear panel D Type connector. A logic 1 on the burst control turns the RF on over a time interval corresponding to 3 data symbols. Propagation delay is matched to the data path delay. Can be used with the Envelope input.

Burst control is not available with GMSK and FSK modulation types.

ON/OFF Ratio
Greater than 80 dB.

ADVANCED DIGITAL MODULATION
In advanced digital mode the instrument will produce TETRA modulation, π/4 DQPSK at 18 ksymbols/s through a Root Raised Cosine Filter with α of 0.35.

Adjacent Channel Power
Adjacent Channel Power across RF frequency range 100 MHz to 490 MHz and temperature range ±25°C ±5°C with IQ errors and fading disabled <70 dBc at ±25 kHz offset

Carrier Leak
Better than -35 dBc (typically < -38 dBc)

VECTOR MODULATION
Provides for IQ modulation of the carrier output from an external source for carrier frequencies of 10 MHz to 1.35/2.7 GHz.

Carrier Leakage and SSB Image Rejection
Following self-calibration, the RF carrier leakage and SSB image rejection are typically 50 dB.

Vector inputs
IQ inputs on the front panel. The RF level requested is obtained with 0.5 V DC applied to one of the inputs. Input impedance is selectable between 50 Ω and 300 Ω.

DC Vector accuracy
For carrier frequencies up to 2 GHz:
- ±1% amplitude of FS.
- ±1° angle at FS.

For carrier frequencies above 2 GHz:
- ±1.5% amplitude of FS.
- ±1.5° at FS.

Vector bandwidth
±0.5 dB wrt DC for modulation frequencies up to 3 MHz.
±1 dB wrt DC for modulation frequencies up to 10 MHz and carrier frequencies up to 2 GHz. ±1.3 dB wrt DC for carrier frequencies up to 2.7 GHz.

IQ MODULATION CALIBRATION
The signal generator can calibrate the IQ modulator automatically. After a 0.5 hour warm up period the calibration remains valid for at least 3 hours over a temperature range of ±5°C. The instrument displays a warning if the calibration validity time or temperature range has been exceeded. Calibration is valid for both digital and vector modes.

FADING SIMULATION
Rayleigh and Rician fading can be simulated in both Vector and Digital modulation modes. Doppler speed can be entered from 0 to 200 Hz with a maximum ratio of 2:1 between direct and scattered speed. Path ratio can be set to ±50 dB.

Note: Fading is not available in either GSM or OQPSK modes.

ENVELOPE CONTROL
The RF level can be varied by applying a control voltage to the envelope input in digital and vector modes. The input may be used to shape the rise and fall of an RF burst and simulate the effect of varying RF levels being received from mobiles in TDMA systems. Applying 1 V gives the set RF level and 0 V suppresses the carrier.

Linear range
Greater than 30 dB.
Linearly typically better than 0.5 dB at –20 dBV (100 mV input).

ON/OFF ratio
Greater than 80 dB.

Envelope delay
<10 µs, typically 6 µs.

Rise/fall time
Less than 13 µs to –70 dBc.

IF OUTPUT
An IF output is available on the rear panel which is modulated by the selected digital or vector modulation. The IF output can be used to provide modulated carriers at higher frequencies by external frequency conversion. The RF output from the front panel connector can be used as an LO for external frequency conversion.

MODULATION OSCILLATOR
Frequency range
0.1 Hz to 500 kHz.

Selection
By keyboard entry of data. Variation by 0 0 keys and by rotary control.
Indication
7 digits with annunciators.

Resolution
0.1 Hz.

Frequency accuracy
As frequency standard.

Distortion
Less than 0.1% THD in sine wave mode at frequencies up to 20 kHz.

Alternative waveform
A triangular wave is available in addition to the sine wave for frequencies up to 100 kHz.

Signalling tones
The modulation oscillator can be used to generate sequential (up to 16 tones) or sub-audible signalling tones in accordance with EIA, ZVEI, DZVEI, CCEI, EURO 1, EEA, NATAL and DTMF* standards.

Facilities are also available for creating and storing user defined tone systems.

* Requires second modulation oscillator (option 001) to be fitted.

EXTERNAL MODULATION

Two independent inputs on the front panel with BNC connectors, EXT MOD 1 and EXT MOD 2. The modulation is calibrated with 1.414 V peak (1 V RMS sine wave) applied. Input impedance 100 kΩ nominal.

MODULATION ALC

The EXT MOD 1 and EXT MOD 2 modulation inputs can be levelled by an ALC system.

Level Range
1 V to 2 V peak (0.7 to 1.4 V RMS sine wave).

Distortion
Less than 0.1% additional distortion for frequencies up to 20 kHz (typically less than 0.1% up to 50 kHz).

1 dB Bandwidth
Typically 10 Hz to 500 kHz.

LF OUTPUT

Front panel BNC connector. The output may be configured in the LF Generator Mode to give an output from the internal modulation oscillator and in the LF Monitor Mode to give an output from the internal modulation signal paths.

Selection
By keyboard entry of data. Variation by † ‡ keys and by rotary control.

Indication
7 digits with unit annunciators for frequency and 4 digits with unit annunciators for level.

Level
100 µV to 5 V RMS with a load impedance of greater than 600 Ω.
100 µV to 1.4 V RMS with a load impedance of greater than 50 Ω.

Source impedance
5.6 Ω nominal.

Level accuracy at 1 kHz
With a load impedance of greater than 10 kΩ LF ±5% for levels above 50 mV LF ±10% for levels from 500 µV to 50 mV.

Frequency response
Typically < ±1 dB from 0.1 Hz to 300 kHz.

Sweep

Control modes
Start/stop values of selected parameter. Number of steps. Time per step.

Step time
1 ms to 20 s per step.

Sweep ramp
Synchronized analog ramp with a nominal amplitude of 0 to 10 V peak on rear panel BNC connector.

Markers
User selectable markers for frequency or level provide an indication when specified parameter values have been reached. Output 0 V to +5 V from 600 Ω on rear panel BNC connector.

Trigger
Rear panel BNC connector. Applying 0 V or a switch closure starts the sweep. Connector is internally connected via 10 kΩ pull-up resistor to +5 V.

FREQUENCY STANDARD

Frequency
10 MHz.

Temperature stability
Better than ±5 in 10⁸ in the operating range of 0 to 50°C.

Warm up time
Within 2 in 10⁷ final frequency within 10 minutes from switch on at 20°C ambient.

Ageing rate
Better than 2 in 10⁷ per year.

Output
Rear panel BNC socket provides an output at frequencies of 1, 5 or 10 MHz with a nominal 2 V pk-pk level into 50 Ω. Output can be disabled.

External input
Rear panel BNC socket accepts an input at 1, 5 or 10 MHz with an input level in the range 220 mV to 1.8 V RMS into 1 kΩ.

GENERAL

GPIB INTERFACE

A GPIB interface is fitted. All functions except the supply switch and display contrast are remotely programmable.

Capabilities
Designed in accordance with IEEE488.2.
Compiles with the following subsets as defined in IEEE Std. 488.1. SH1, AH1, T6, L4, SR1, RL1, PPO, DC1, DT1, C0, E2.

ELECTROMAGNETIC COMPATIBILITY

Conforms with the protection requirements of the EEC Council Directive 89/336/EEC. Conforms with the limits specified in the following standards:
IEC/EN61326-1: 1997, RF Emission Class B, Immunity Table 1, Performance Criteria B.
SAFETY
Conforms with the requirements of EEC Council Directive 73/23 EEC (as amended) and the product safety standard IEC / EN 61010-1 : 2001 + C1 : 2002 + C2 : 2003 for class 1 portable equipment, for use in a Pollution Degree 2 environment. The instrument is designed to be operated from an Installation Category 2 supply.

RATED RANGE OF USE (Over which full specification is met unless otherwise stated)
Temperature
0 to 55°C.
Humidity
Up to 93% at 40°C.

CONDITIONS OF STORAGE AND TRANSPORT
Temperature
–40°C to +71°C.
Humidity
Up to 93% relative humidity at 40°C.
Altitude
Up to 4600 m (15,000 ft).

POWER REQUIREMENTS
AC supply
Four voltage settings covering:
100 V~ (Limit 90 - 115 V~)
120 V~ (Limit 105 - 132 V~)
220 V~ (Limit 188 - 242 V~)
240 V~ (Limit 216 - 264 V~)
Frequency: 50 - 400 Hz (Limit 45 - 440 Hz) 180 VA max

CALIBRATION INTERVAL
2 years.

DIMENSIONS AND WEIGHT
(Over projections but excluding handles)
Height Width Depth Weight
152 mm 425 mm 525 mm 21 kg
6 in 16.6 in 20.5 in 46 lb

OPTIONS
OPTION 1 - SECOND MODULATION OSCILLATOR OPTION
Specification as Modulation Oscillator.

OPTION 2 - PULSE MODULATION OPTION
Modulation Modes
Pulse modulation may be used alone or in conjunction with FM, FM, Wideband FM, Vector or Digital Modulation.
Rise / Fall Time
25 ns.
Control
0 V for carrier off, +5 V for carrier on. Threshold level is typically +2.5 V.
ON/OFF Ratio
Better than 70 dB.
Input impedance 50 Ω.

OPTION 105 - SLOW RISE TIME PULSE MODULATION
Modifies pulse modulation option for a typical rise and fall time of 1 μs.

OPTION 6 - AVIONICS
See separate sheet.

OPTION 8 - RF PROFILE AND COMPLEX SWEEP
See separate sheet.

OPTION 12 - ELECTRONIC ATTENUATOR
Carrier Frequency Range
250 kHz* to 1.35 GHz (2050T),
250 kHz* to 2.7 GHz (2051T).
* Useable to 10 kHz (50 MHz in Digital, Advanced Digital or Vector modes, useable to 10 MHz)
RF Output
Range (Analog mode)
-138 dBm to +10 dBm When AM is selected the maximum output level reduces linearly with AM depth to +4 dBm at maximum AM depth.
Range (Digital or Vector mode)
-132 dBm to +3 dBm peak envelope power.
Range (Advanced digital mode)
-144 dBm to -9 dBm
Accuracy
±1.2 dB in non Digital or Vector modes for output levels > -127 dBm at 22°C ± 5°C
Temperature Stability
±0.01 dB/°C
VSWR
< 1.5:1 for output levels less than 0 dBm.
Reverse Power Handling
1 W from a source VSWR of up to 5:1.
Amplitude Modulation
Standard specification applies for carrier frequencies above 50 MHz (Above 100 MHz for Option 6)

Signal Sources

IFR 3410 Series Digital RF Signal Generators

- Wide frequency coverage
  250 kHz to 2 GHz (3412)
  250 kHz to 3 GHz (3413)
  250 kHz to 4 GHz (3414)
  250 kHz to 6 GHz (3416)
- Fast RF frequency and level settling for high speed testing
- High performance vector modulation for improved component test
- Optional dual channel arbitrary waveform generator (ARB)
- Low adjacent channel power for receiver selectivity and amplifier linearity testing
- Fast GPIB response to maximize ATE system performance
- iQCreator® RF waveform creation software
- Wide bandwidth FM and AM modulation capability
- Optional Differential I/Q outputs for simplified component test interfacing
- Optional high speed pulse modulation capability
- Compact and lightweight package
- Simple to use touch panel interface
- RF optimization modes - Auto, Low Noise, Low ACP and Higher Power

The IFR 3410 series are portable, lightweight signal generators covering a wide range of carrier frequencies to 6 GHz. High quality analog and vector modulation capabilities make these signal generators ideal for research, development and manufacturing applications.

Careful attention to the design of the modulators and the RF system ensures that these signal generators exhibit low levels of adjacent channel power, making them suitable for the most demanding amplifier linearity and receiver selectivity measurements.

The use of Aeroflex fractional N synthesis techniques, combined with fast level control and an electronic attenuator, ensures the 3410 series signal generators are both frequency and level agile for high speed ATE testing.

Operation

A flexible but intuitive user interface based on a touch panel display system ensures that the signal generator meets the needs of unskilled as well as skilled operators. The instrument can be configured to the required mode of operation very simply, with numerical data being entered by the keyboard or via a rotary control. The display shows the primary parameters in a clear and unambiguous format, minimizing the risk of operator error.

RF Output

The 3410 series signal generators provide peak output power of up to +16 dBm. With a level resolution of 0.01 dB, repeatable and accurate testing of wireless components can be performed.
The electronic attenuator is ideal for high volume applications where attenuator life is critical. A user defined RF level limit can be entered to ensure that the signal generator cannot provide damaging signal levels when testing less robust components. Careful attention to the level control system guarantees that positive level transients cannot be generated. The fast responding electronic reverse power protection system helps ensure long life and high reliability when testing high power systems.

**Spectral Purity**

Receiver measurements require good spectral purity from a signal generator. The 3410 series has excellent performance with typically 1.5 Hz residual FM at 1 GHz and a floor noise of typically better than -148 dBc/Hz.

**Frequency and Level Setting Times**

Fast frequency and RF level setting times are key parameters in achieving minimum test execution times and therefore maximum throughput, in production environments. The 3410 series with typical frequency setting times of 2 ms and level setting times of 2.5 ms provide outstanding performance.

In addition to comprehensive sweep functions for carrier frequency, RF level and modulation oscillator 3410 series provides an extremely fast optional sweep mode for frequency and level settings through the use of user stored lists. Option 010, List Mode has a setting time of less than 500 µs and is ideal for frequency hopping and semiconductor production applications.

**Modulation**

Comprehensive modulation facilities are provided for supporting the testing of analog or digital RF systems. A single key press turns the modulation on and off, providing a fast method for signal to noise checking.

**Vector Modulation**

The built-in IQ modulator provides state-of-the-art vector modulated signals with excellent level linearity, low vector error and low noise. With a typical vector bandwidth up to 55 MHz, the modulator is able to support wideband as well as narrow-band wireless standards. Internal calibration systems ensure the modulator performance can be quickly optimized to reduce vector errors and ensure low carrier leak at all operating frequencies.

The linearity of the modulator and the RF output system is reflected in the excellent adjacent channel power when generating multi-carrier non-constant envelope signals such as cellular CDMA and TETRA.

**Analog Modulation**

With typical AM bandwidth to 30 MHz and typical FM bandwidth to 20 MHz, the 3410 series signal generators are ideal tools for testing broadcast systems. The wide bandwidths allow video signals to modulate the carrier with minimal distortion.

The wideband FM facilities allow the generation of fast-swept signals, while the use of a patented DC FM system ensures that carrier frequency errors when the FM is DC coupled are minimal.

The specifications for AM are maintained to high carrier frequencies to support the use in modern EMC testing applications. The signal generator maintains excellent phase noise performance even when generating wideband modulated signals.

**Modulation Oscillator**

An internal modulation oscillator is provided which can be used to generate two tones in the frequency range 0.1 Hz to 50 kHz (16 MHz with Option 005 ARB Waveform Generator). In addition to sine waves, the modulation oscillator can provide square waves, triangular and sawtooth waveforms for narrow band sweeping.

**Digital Modulation**

The user has a choice of either a Dual Arbitrary Waveform Generator or a Real Time Baseband Generator for producing digitally modulated output signals.

**Dual Arbitrary Waveform Generator**

Fitted internally, the optional Dual Channel Arbitrary Waveform Generator allows the user to select from a library of pre-stored IQ modulator drive waveforms to provide accurately modulated carriers simulating the characteristics of digitally modulated communication systems. Burst modulation and alternate level rf attenuation facilities are provided for TDMA signal simulation. Marker output signals can be placed within the waveform to simplify triggering and synchronization with external test equipment. Using a patented technique, the dual channel ARB is able to take waveform files typically four times oversampled and run them through a real time interpolation.
system to raise the sampling rate of the file. This ensures the generation of low adjacent channel power and low spectral noise density. The dual channel ARB is suited for the generation of both narrow band and wideband signals, including WCDMA signals, without the use of switched reconstruction filters. Combining a large ARB memory with the smaller file size required to define a waveform allows the ARB to store up to 180 waveforms. Alternatively the whole of the memory can be devoted to a single file. One such file would store over 1.5 seconds of a 3GPP WCDMA waveform signal. The use of interpolation techniques ensures that when narrow band systems are simulated the waveform generator can still operate at a high sample rate without requiring excessively large amounts of data to be loaded or restricting the repetition time. The library waveforms are structured in a directory form to ease their selection and the optimization of the user's generator. The modulation waveforms can be simply changed by selection from a file list with the changeover between waveforms occurring in a few milliseconds rather than the many seconds required in more traditional waveform generators. The file name can be determined by the user to convey a useful description of the contents of the file.

Real Time Baseband Generator
Fitted internally, the optional Real Time Baseband, RTBB, generates baseband signals (I and Q) that modulate an RF source in real time to produce generic FSK, PSK and QAM signals at rates up to 2 Msymbol/sec. The RTBB generates or inputs a set of modulation symbols, modulates them with the chosen scheme, filters them using an appropriate channel filter, and then converts the digital stream to analogue I and Q for the I/Q vector modulator. The source of the symbol data is very flexible. The symbol data can originate from a variety of internal or external sources. Internal data source choices include a PRBS generator, an internal pattern generator or internal memory storage of user downloaded symbols. External real-time symbol data can be input in serial or parallel format via an industry standard Low Voltage Differential Signalling (LVDS) interface.

Digitized I/Q data, available from sources such as basestation simulators, can be input via the LVDS interface as an alternative to external parallel or serial data. Streaming digitized I/Q data samples are available as an output via the LVDS interface from internally generated symbols for testing D/A converters.

Synchronized clock, RF Burst, RF Burst Attenuation control and marker output signal facilities are available for both internal and external data generation.

An important feature necessary to support GSM signal generation is the ability to frequency hop between channels. The RTBB option provides frequency hopping by re-mixing the I and Q data at baseband. The resultant I and Q vectors then modulate the core synthesizer frequency thus producing a new RF frequency at the output of the signal generator. This method ensures that synchronization is maintained between the IQ data and the hop trigger. In addition, because the main synthesizer hardware remains unchanged, frequency stabilization is nearly instantaneous.

IQCreator® is a Windows based software utility that enables a user to set up a modulation scheme and then create an ARB file using modulation templates. The resulting file may be saved on a PC or downloaded into the ARB. User-defined configurations can also be saved. Consequently, it is possible to load previously saved setups to regenerate the ARB files quickly and easily. The capabilities of IQCreator® include:-

Generic Modulation Types
- PSK, FSK, MSK, QAM modulation types
- Nyquist, Root Nyquist and Gaussian filters
- PRBS, fixed pattern and user defined data sources
- IQ errors - residual carrier, IQ imbalance, quadrature offset
- Multi-carrier

Also included are 2G, 2.5G and 3G cellular TDMA and CDMA digital standards along with WLAN and other cordless phone standards.

In addition, IQCreator® includes a utility that allows user-defined waveforms, created using software simulation tools such as MATLAB, to be converted and packaged into a form that can be downloaded into the 3410 Series ARB.

IQCreator® is continually updated to include new modulation capabilities and facilities. The latest version is available for download at www.aeroflex.com.

Options to have an instrument’s ARB pre-loaded with a suite of example waveform files are available. A selection of waveforms from each of the standards, or just waveforms relevant to the user’s applications, can be chosen. Although only available at the time of order, all the waveforms are available within IQCreator should any of the files be deleted then required in the future.

I/Q Outputs
Single ended baseband I/Q outputs are available as standard. Differential I/Q outputs, combined with comprehensive voltage bias and offset facilities, are optionally available to simplify component and module testing.

Pulse Modulator
An optional pulse modulator allows the generation of fast rise time RF signals with on/off ratios that meet the most demanding radar and ECM/ECM test applications.

Remote Control
The 3410 series include both fast GPIB and Ethernet remote control interfaces for flexibility in production environments. RS-232 control is also provided for use in legacy ATE systems.

The protocol and syntax of the GPIB commands have been designed for equipment facilities held on standby.

Frequency Standard
The 3410 series includes a high stability OCXO as standard. The inclusion of a main input power standby mode maintains the oscillator at working temperature while the rest of the instrument is powered down. Time to full specification working is thereby minimized for equipment facilities held on standby.
Size
The 2U rack height ensures the 3410 series occupies minimal space in a manufacturing rack or on the engineer’s bench, allowing the provision of more compact test systems. The full rack width ensures easy stacking of instruments while the light weight allows for easy carrying in the laboratory or the field.

SPECIFICATIONS

CARRIER FREQUENCY

Range
250 kHz - 2 GHz (3412)
250 kHz - 3 GHz (3413)
250 kHz - 4 GHz (3414)
250 kHz - 6 GHz (3416)

Resolution
1 Hz, accuracy as frequency standard
The carrier output phase can be advanced or retarded in increments of 0.036°.

FREQUENCY SETTING TIME (NON-LIST MODE)
After receipt of the GPIB interface delimiter (terminator), 23°C ± 5°C
Phase Noise Mode Optimized >10 kHz
<5.5 ms, typically 4 ms, ≤375 MHz, to be within ≤200 Hz
>375 MHz, to be within ≤0.1 ppm

Phase Noise Mode Optimized <10 kHz
<3 ms, typically 2.5 ms, ≤375 MHz, to be within ≤200 Hz
<2.5 ms, typically 2 ms, >375 MHz, to be within ≤0.1 ppm

FREQUENCY SETTING TIME (OPTION 010 LIST MODE)
After external trigger in List Mode, 23°C ± 5°C
Phase Noise Mode Optimized >10 kHz
<4 ms, typically 3 ms, ≤375 MHz, to be within ≤200 Hz
>375 MHz, to be within ≤0.1 ppm

Phase Noise Mode Optimized <10 kHz
<600 µs, typically 500 µs, ≤375 MHz, to be within ≤200 Hz
<500 µs, typically 450 µs, >375 MHz, to be within ≤0.1 ppm

RF OUTPUT

The RF output is controlled by an ALC system in normal operation. When IQ modulation is enabled alternative control modes are available to optimize the performance of the signal generator.

Range

Electronic Attenuator

\[
\begin{align*}

& : \leq 6 \text{ GHz} \ : +1.00 \text{ dB}
\end{align*}
\]

Level Accuracy With IQ Modulation

For constant envelope modulation systems: typical standard level error ≤±0.15 dB
For non-constant envelope modulation systems: typical standard level error ≤±0.25 dB

Temperature Stability

\[
\begin{align*}
\pm 0.01 \text{ dB/°C} & , \leq 3 \text{ GHz} \\
\pm 0.02 \text{ dB/°C} & , \leq 4 \text{ GHz} \quad \pm 0.02 \text{ dB/°C} \quad \text{typical,} \leq 6 \text{ GHz}
\end{align*}
\]

RF Flatness

![Typical flatness at 0 dBm](image)

LEVEL SETTING TIME

Electronic attenuator, Option 003 is assumed in all cases.

ALC loop bandwidth ‘Moderate’ or ‘Broad’, to be within ≤0.3 dB

Level Setting Time (Non-List Mode)

After receipt of the GPIB interface delimiter (terminator), 23°C ± 5°C
<4.5 ms, typically 2.5 ms

Level Setting Time (Option 010 List Mode)

After external trigger in List Mode, 23°C ± 5°C
<3 ms, typically 1.5 ms
**Output VSWR**

**Electronic Attenuator**

For output levels < 0 dBm:

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Output VSWR</th>
</tr>
</thead>
<tbody>
<tr>
<td>≤ 2 GHz</td>
<td>&lt; 1.25:1</td>
</tr>
<tr>
<td>≤ 3 GHz</td>
<td>&lt; 1.40:1</td>
</tr>
<tr>
<td>≤ 4 GHz</td>
<td>&lt; 1.50:1</td>
</tr>
<tr>
<td>≤ 6 GHz</td>
<td>&lt; 1.60:1</td>
</tr>
</tbody>
</table>

For output levels > 0 dBm VSWR is < 1.5:1, ≤ 4 GHz, < 1.8:1 ≤ 6 GHz

**Mechanical Attenuator**

For output levels < 0 dBm:

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Output VSWR</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

**Attenuator Repeatability**

Mechanical attenuator typically 0.1 dB

**Output Connector**

Front panel 50 Ω type N female to MIL-PRF-39012 class 2

**Output Protection**

Protects the instrument from externally applied RF power (from a 50 Ω source) of 50 W up to 3 GHz and 25 W up to 4 GHz

The RPP trip may be reset from the front panel or via the remote interface. For safety, the protection is also provided when the instrument is switched off.

3416 damage level 0.5 W (+27 dBm) from a max 5:1 VSWR, all frequencies

**SPECTRAL PURITY**

All parameters stated at RF level ≤ +7 dBm in Noise and ACP RF modes

**Harmonics**

< -30 dBc, typically < -40 dBc

**Sub- and Non-Harmonics**

For offsets > 10 kHz:

< -70 dBc for carrier frequencies ≤ 3 GHz

< -60 dBc for carrier frequencies ≤ 6 GHz

**Residual FM (FM on CW)**

< 2.5 Hz RMS (typically 1.5 Hz) at 1 GHz in a 300 Hz to 3.4 kHz unweighted bandwidth

**SSB Phase Noise**

For 20 kHz offset, Noise Optimized mode

MODULATION

FM, AM and φM can be applied to the carrier using internal or external modulation sources. The internal modulation source is capable of generating two simultaneous signals into any one of the modulation channels. The internal and external modulation sources can be simultaneously enabled in order to produce combined amplitude and frequency (or phase) modulation.

Internal and external IQ modulation can be applied. In this mode, FM, AM and φM are not permitted.

Optional Pulse modulation can be used in combination with FM, AM, φM and IQ from an external pulse source.

FREQUENCY MODULATION

Displayed resolution is 4 digits or 1 Hz.

FM Accuracy

At 1 kHz rate
±3% of set deviation excluding residual FM

FM Bandwidth

0.5 dB  DC to 200 kHz (DC coupled, 100 kΩ)
10 Hz to 200 kHz (AC coupled, 100 kΩ)
3 dB  Typically 20 MHz (DC or AC coupled, 50 Ω)

Total Harmonic Distortion

At 1 kHz rate
<0.15% for deviations up to 2% of maximum allowed deviation
<0.6% for deviations up to 20% of maximum allowed deviation
<1.5% at maximum deviation

PHASE MODULATION

Phase Deviation

0 to 10 radians
Displayed resolution is 4 digits or 0.01 radians.

Accuracy

At 1 kHz rate
±4% of set deviation excluding residual phase modulation

Bandwidth

0.5 dB 100 Hz to 10 kHz (AC coupled, 100 kΩ)

Total Harmonic Distortion

At 1 kHz rate
<0.5% at 10 radians deviation
Typically <0.1% at 1 radian deviation

AMPLITUDE MODULATION

Specifications apply for carrier frequencies from 2 MHz up to 2 GHz, usable to 4 GHz and ‘Noise’ or ‘ACP’ RF modes.

Maximum specified output power is reduced by 2 dB, ≤10 MHz for ‘No attenuator’ Option 001 with AM selected.

Modulation Depth

0 to 99.9%, Displayed resolution is 3 digits or 0.1%
Accuracy
At 1 kHz rate
±4% of set depth ±1% excluding residual AM

AM Bandwidth
1 dB  DC to 200 kHz (DC coupled, 100 kΩ)
10 Hz to 200 kHz (AC coupled, 100 kΩ)
3 dB  Typically 30 MHz (DC or AC coupled, 50 Ω)

Total Harmonic Distortion
For 1 kHz modulation rate
<1% for depths ≤30%
<2% for depths ≤80%

FM on AM
Typically <20 Hz for 30% AM depth at a modulation rate of 1 kHz and carrier frequency of 500 MHz

IQ MODULATION
Performance applicable in ACP and Noise modes only

IQ Inputs
BNC connector inputs, selectable 50 Ω/100 kΩ input impedance

Full scale input \((I^2+Q^2)^{1/2}\) occurs for 0.5 V rms (The level requested is obtained by applying 0.5 VDC to either the I or Q input)

DC Vector Accuracy
Relative to Full Scale (0.5 V RMS)
Static Error Vector Magnitude (EVM) <1% RMS at full scale
Magnitude error <0.5% RMS at full scale
Phase error <0.5° RMS at full scale

Residual Carrier Magnitude:
For 0 V input voltage, relative to full scale

RF Mode
Noise  < -45 dBc, typically < -55 dBc
ACP   < -40 dBc, typically < -50 dBc

Valid for 12 hours after executing an IQ self-calibration and within ±5°C of the calibration temperature. The instrument displays a warning if the time or temperature limits are exceeded.

Static EVM and phase error measured with residual carrier magnitude removed.

IQ Image Suppression
At 10 kHz modulation frequency
Typically < -50 dBc @ 10 kHz

Linearity (See linearity chart over page)
Adjacent Channel Power (ACP), in ACP mode for continuous and discontinuous signals at RF output levels ≤ 0 dBm, over the temperature range 23°C ± 5°C

RF Burst Control
A digital control bit is used to generate an analog ramp (up or down) of the RF output. The Burst Gate control signal can either be generated internally as part of the optional internal base-band source, or provided externally by the user on the rear panel connector. When internally generated, the Burst Gate control signal appears on the rear panel auxiliary connector that then serves as an output.

On/Off Ratio
For the temperature range 23°C ± 5°C
> 90 dB for carriers ≤ 3 GHz
> 80 dB for carriers ≤ 4 GHz
> 65 dB for carriers ≤ 6 GHz

Ramp Profile
Rise and fall time after the L-H and H-L transitions of the burst control bit respectively can be defined by the user from 10 µs to 999 µs in 0.1 µs steps.

Burst Gate control input is a TTL level (HCT), 50 Ω impedance BNC input on the rear panel.

RF ramp can be adjusted in time by ±50 µs in increments of 0.1 µs with respect to the trigger event.

RF Burst Attenuation Control
A digital attenuation control bit (in conjunction with the ramp control bit) is used to decrease the RF level from the set level to an alternative level during burst modulation. The Burst Attenuation Trigger signal can be provided internally as part of the optional dual arbitrary waveform generator (ARB), or externally on a rear panel connector. When internally generated, the Burst Attenuation Trigger control signal appears on the rear panel auxiliary connector that then serves as an output.

Attenuation range available is 0 to 70 dB.

Burst Attenuation Trigger control is a TTL level (HCT), 50 Ω impedance
signal available on the rear panel Auxiliary connector.

RF burst attenuation requires Electronic Attenuator Opt 003.

**INTERNAL MODULATION OSCILLATOR**

The internal modulation source is capable of generating up to two simultaneous signals into any one of the modulation systems.

**Frequency Range**

0.1 Hz to 50 kHz (16 MHz with Option 005) with 0.1 Hz or 5 digits of resolution

**Accuracy**

As frequency standard

**Distortion**

<0.1 % for a sine wave at 1 kHz

In addition to a sine wave the following waveforms can be generated:

- Triangle 0.1 Hz to 10 kHz (2 MHz with Option 005)
- Ramp 0.1 Hz to 10 kHz (2 MHz with Option 005)
- Square 0.1 Hz to 5 kHz (1 MHz with Option 005)

(Note: modulation frequency can be set to 50 kHz irrespective of waveform type)

**Level**

Modulation source signals are available on the rear panel I/AM OUT and Q/FM OUT at nominal level of 1 V peak EMF from 50 Ω source impedance.

**EXTERNAL MODULATION SOURCE**

External inputs are available with a selectable input impedance of 50 Ω or 100 kΩ (default setting), AC or DC coupled.

Apply 1 V RMS (default) or 1 V peak for the set modulation.

A HI/LO indicator when the applied signal is greater than ±6% from nominal

External AM is input to EXT I/EXT AM front panel BNC connector.

External FM is input to EXT Q/EXT FM front panel BNC connector.

**INTERNAL DUAL CHANNEL ARB SOURCE (OPTION 005)**

A high performance Dual Arbitrary (ARB) Waveform Generator that provides IQ signals for the IQ modulator

The ARB enables files to be downloaded with sample rates from 17 kHz to 66 MHz. The ARB uses an interpolation system to increase the digital to analog converter sample rate and avoid the use of reconstruction filters.

**ARBITRARY WAVEFORM GENERATOR CHARACTERISTICS**

- Typical 3GPP test model 1 (64 channels)

**3GPP/WCDMA**

**LINEARITY CHART**

* denotes typical value  ** At RF o/p level ≤-4 dBm
Interpolation Factor
Automatically selected

Reconstruction Filter Stop Band Attenuation
> 70 dB

ARB Spectral Purity
Spurious free dynamic range > 70 dB, typically > 80 dB
20 kHz offset phase noise < -120 dBc/Hz
Floor noise < -140 dBc/Hz

Analyzer
Windows based software package is provided for the creation, formatting and downloading of ARB waveform files to the 3410 series.

A waveform library is provided on a CD containing a selection of files for testing 2G, 2.5G and 3G systems. Files can be downloaded from www.aeroflex.com.

Marker Control Bits
Up to 3 marker bits (1-3) can be attached to each sample of IQ data. These can be used to indicate significant points in the waveform and are available as HC CMOS outputs via the rear panel Aux IN/OUT connector. Marker bit 1 can be used as RF Burst Control signal. Marker bit 2 can be used as Burst Attenuation Trigger signal to decrease (attenuate) the RF level from its nominal value.

Control Mode
Continuous, single or triggered operation of the ARB
An external TTL trigger input signal is available on the AUX IN/OUT rear panel connector.

IQ Outputs (Not applicable with Option 009 fitted)
The IQ outputs produced by the ARB are available on the rear panel I/AM OUT and Q/FM OUT BNC connectors. Output level is 0.5 V RMS EMF (vector sum) from a source impedance of 50 Ω.

REAL TIME BASEBAND (OPTION 008)
Allows the creation of digitally modulated signals using generic modulation formats. An internal data source provides PRBS or fixed patterns. External real-time data in the form of symbol data, or digital IQ data may be applied via an LVDS interface.

Generic Modulation Formats
PSK
- BPSK, QPSK, 8PSK, 16PSK
- 8PSK EDGE (8PSK with 3π/8 rotation)
- π/2 DBPSK, π/4 DQPSK, π/8 DBPSK
- DBPSK, DQPSK, DBPSK
- 8QPSK (time offset)

MSK
- GSMK

FSK/GFSK
- 2 and 4 level symmetric

QAM
- 16, 32, 64, 128, 256 levels

For data bit to symbol mapping information refer to Technical Note "IFR 3410 Option 8 RTBB Ancillary Information"

SYMBOL RATE
Range
5 kHz to 2 MHz, Resolution 1 Hz

BASEBAND CHANNEL FILTERS
Filter Types
- Nyquist a = 0.1 to 0.8, resolution 0.01
- Root Nyquist a = 0.1 to 0.8, resolution 0.01
- Gaussian
  - Bit 0.1 to 1.0, resolution 0.1
- EDGE
  - "Linearized Gaussian" as defined in GSM 05.04

DATA SOURCE
Formats
- Internal Data
- PRBS - PN9, PN11, PN15, PN16, PN20, PN21, PN23.
- Fixed Pattern consisting of -
  - 0, 0, 0, 0, 0, 0 ....
  - 0, 1, 0, 1, 0, 1 ....
  - 1, 0, 1, 0, 1, 0 ....
  - 1, 1, 1, 1, 1, 1 ....
- User-defined symbol file stored in non-volatile memory (Max size 256 kB)

External Serial Data
A single bit stream representing symbol information can be applied. The bit to symbol conversion is determined from the selected modulation type.

External Parallel Data
Symbol information consisting of 1 to 8 data bits can be applied. External parallel and serial data is input via the LVDS connector on the rear panel.

DATA ENCODING
None, Differential, GSM Differential, Inverted

TIMING/SYNCHRONIZATION
All clock and synchronization signals are provided internally by Option 8 RTBB and made available to the user on the rear panel LVDS connector. An external clock may be phase aligned to the internal clock via a "sync" operation.

External Serial Data Clock
Eight times the symbol rate, for all modulation types.

External Parallel Data Clock
Nominal symbol rate

FREQUENCY HOPPING
Frequency Hop List
Up to 32 frequency values. The frequency values entered represent offset values from the current RF frequency.

Frequency Offset Values
Offset values range ±10 MHz

MODES
Linear
On receipt of a hop trigger, the next frequency in the list is indexed.

Random
On receipt of a hop trigger, an internal PRBS generator indexes through the frequency list. PN length and polynomial initial seed value are user selectable. PN values selectable from - 9, 11, 15, 16, 20, 21, and 23.

External
On receipt of a hop trigger, the 5-bit hop address lines applied to the LVDS connector are used to index the frequency list.

Hop Rate
Max hop rate (hops/sec) is half symbol rate. Hopping is synchronized to symbol transition.

DIGITAL IQ DATA
Digital IQ data is available via the LVDS connector on the rear panel.

EXTERNAL IQ DATA IN
External 16-bit IQ data can be applied to an LVDS interface. The data can then be filtered or not, depending on the application, by the baseband board and fed to the DACs. All clock and sync signals are located...
on the LVDS connector. These can be used to synchronize to an externally applied clock.

**INTERNAL IQ DATA OUT**
16-bit IQ data is available on the LVDS interface when the modulation is generated internally. Outputs can be disabled.

**TONES**
A tone (CW) only mode is available. Up to 2 tones may be selected. Each tone may be independently enabled and disabled.

Frequency Range carrier frequency ± 10 MHz
Relative Level 60 dB

**DIFFERENTIAL I/Q OUTPUT (OPTION 009)**
When differential I/Q outputs are enabled signal generator RF carrier output is CW only.

**Output Impedance**
Can be used with single ended 50 Ω loads or differential 100 Ω loads. Delivered bias voltages are halved with single ended loads.

**I/Q Bias Voltages**
Independent I and Q channel bias voltages settable within the range of ±3 V

Bias Voltage
Resolution 1.0 mV nominal
Accuracy ±2% ±4 mV max, ±1% ±2 mV typical
Offset See Bias Voltage above.

**Differential Offset Voltage**
Range ±300 mV
Resolution 100 µV nominal
Accuracy ±2% ±3.3 mV max, ±1% ±0.7 mV typical

**Level Mode**
Variable IQ signal level over 45 dB range

**Differential Signal Balance**
typ 0.15 dB @10 MHz

**I/Q Channel Balance**
±0.2 dB @1 MHz

**I/Q Level Imbalance Adjust**
±4 dB nominal continuously variable

**I/Q Signal Amplitude**
22.4 mV to 4 V pk-pk per channel

**I/Q Signal Amplitude Accuracy**
<2% at 20 kHz, typ 1.5%, excludes termination errors

**Baseband Purity (2 V p-p set voltage at 1 MHz)**
2nd Harm -70 dBc
3rd Harm -65 dBc
IMD -70 dBc (100 kHz tone spacing, at 1 MHz)

**SWEEP FACILITY**
Provides a digital sweep of RF frequency, RF level and Analog Modulation Sources in discrete steps

Start, stop, step size, number and step time can be controlled. Step time may be set from 2.5 ms to 10 s with 0.1 ms resolution. (20 ms for mechanical attenuator Option 002)

The sweep can be set to be continuous, single or externally triggered from the rear panel. TTL BNC Female rear panel.

**Frequency Sweep**
Linear step size: 1 Hz minimum step

**FAST PULSE MODULATOR (OPTION 006)**
This option requires Electronic Attenuator Option 003 to be fitted.

**On/Off Ratio**
>80 dB for carrier levels ≥ -60 dBm

**Rise/Fall Time**
<20 ns typical (10 to 90%)

**Pulse Delay**
Typically <50 ns

**RF Level Accuracy**
RF mode = ‘auto’, as standard ±0.2 dB
The above specification is met for all power levels above 150 MHz.

**AM Depth and Distortion**
AM operation is unspecified below 10 MHz.
AM depth and distortion specification is degraded for operation above 0 dBm at carrier frequencies <150 MHz.

**Video Breakthrough**
RF Mode
Power <±50 mV for RF levels >+10 dBm
<±25 mV for RF levels in the range -10 dBm to +10 dBm
<±10 mV for RF levels ≤-10 dBm

Noise <±50 mV for RF levels >+4 dBm
<±25 mV for RF levels in the range -16 dBm to +4 dBm
<±10 mV for RF levels ≤-16 dBm

ACP <±50 mV for RF levels >-6 dBm
<±25 mV for RF levels in the range -26 dBm to -6 dBm
<±10 mV for RF levels ≤-26 dBm

**Modulation Source**
PULSE IN BNC (female) connector rear panel

**Input Impedance**
50 Ω

**Input Level**
TTL level (HCT)

**Control Voltage**
A HCT logic 0 (0 V to 0.8 V) turns the carrier OFF
A HCT logic 1 (2 V to 5 V) turns the carrier ON

**Max. Safe Input Level**
±10 V

**NON-VOLATILE MEMORY STORES**
Full instrument configurations can be saved to 100 memory stores (0 - 99).
**FREQUENCY STANDARD**

- 10 MHz OCXO fitted as standard

**Ageing Rate**

< ±0.8 x 10⁻⁷ per year after 30 days continuous use

**Temperature Coefficient**

< ±5 x 10⁻⁸ over the temperature range 0°C to 50°C

**Output Frequency**

Within 2 x 10⁻⁷ of final frequency after 10 minutes from connecting supply power and switching on at a temperature of 20°C

Standby power is provided while the instrument is off but connected to the supply.

Output of 2 V pk-pk from 50 Ω is provided on a rear panel BNC connector.

**EXTERNAL STANDARD INPUT**

- 1 MHz or 10 MHz at a level of 300 mV RMS to 1.8 V RMS into 1 kΩ on the rear panel BNC connector

**REAR PANEL OUTPUTS (OPTION 007)**

With this option fitted RF output, EXT I/EXT AM input and EXT Q/EXT FM input connectors are transferred to the rear panel. When Option 009 is fitted only RF output connector is transferred to the rear panel. The standard signal generator specification remains unaltered.

**GENERAL**

**WARRANTY**

2 years with options for 3, 4 and 5 years

**CALIBRATION INTERVAL**

Recommended at 2 years

**REMOTE CONTROL INTERFACES**

**Ethernet**

All signal generator parameters except the supply switch are remotely programmable. The following LAN protocols supported:

- V8.11
- Telephone Network (TELNET)
- File Transfer Protocol (FTP) (instrument firmware upgrades only)

**GPIB**

All signal generator parameters except the supply switch are remotely programmable. The GPIB is designed in accordance with the IEEE 488.2.

**RS-232**

All functions except the supply switch are remotely programmable. Can be used for upgrading the instrument firmware without removal of the instrument covers.

**Interface Functions**

SH1, AH1, T6, L4, SR1, RL1, PP0, DC1, DT1, CO, E2

Supplied with AC power supply lead and CD-ROM containing:

- Operating Manual
- Data Sheet
- Factory Test Results (for the unit supplied) and Certificate of Calibration

**IQCreator**

- ARB data file creation and download software
- VISA Plug ‘n’ Play driver software
- Library of common data files for dual ARB option
**Attenuator Options**

3410 must be ordered with one of the following attenuator options. Refer to main specification for details.

- **Option 001** No attenuator
- **Option 002** Mechanical attenuator (Not available on 3414/3416 )
- **Option 003** Electronic attenuator

**Further Instrument Options**

- **Option 005** ARB waveform generator (Not available with Option 008)
- **Option 006** Pulse Modulation (Requires Option 003, not available with Option 009)
- **Option 007** Rear panel outputs (RF Output only with Option 009)
- **Option 008** Real Time Baseband (Not available with Option 005 or 009)
- **Option 009** Differential I/Q output (Requires Option 005, not available with Option 006)
- **Option 010** List Mode (Requires Option 003)
- **Option 020** 2G CDMA software license
- **Option 021** 3G CDMA software license

**Warranty Options**

- **Option 203** 3 year warranty
- **Option 204** 4 year warranty
- **Option 205** 5 year warranty

**Pre-Loaded Example Waveforms Options**

- **Option 300** Example waveforms - a selection from each of the standards (Requires Option 021)
- **Option 301** CDMA example waveforms; 3GPP; CDMA2000; IS-95 (Requires Option 021)

- **Option 302** Cellular example waveforms; GSM; EDGE; IS136; PDC
- **Option 303** PMR example waveforms; TETRA, P25
- **Option 304** Avionics example waveforms; VDL
- **Option 305** WLAN example waveforms; 802.11; Bluetooth
- **Option 306** Satellite/Cable example waveforms; Various QAM formats
- **Option 307** Digital cordless example waveforms; DECT; PHS

For details on each waveform included in option 300 series, refer to Technical Note 3410 Option 300 waveform information, Part Number 46891/942

**Optional Accessories**

- 46882/499 Operating manual (paper format)
- 46880/111 Service manual (includes semi-automatic adjustment software)
- 82542 Breakout box (for Auxilliary connector)
- 43129/189 1.5 m GPIB lead
- 46662/745 Soft carry case
- 46884/650 RS-232 cable, 9 way female to female, 1.5 m
- 46884/649 RS-232 cable, 9 way to 25 way female, 1.5 m
- 46885/138 Rack mounting kit (front panel brackets)
- 43139/042 RF double screened connector cable 50 Ω, 1.5 m, BNC (m)
- 54311/095 RF double screened connector cable 50 Ω, 1 m, type N connectors
- 54311/092 Coaxial adapter N male to BNC female
- 59999/163 Precision coaxial adapter N male to SMA female
Signal Sources

3002 VXI Signal Generator

Unique product offering full signal generator functionality with high performance in a VXI module

- Wide frequency coverage
- Sweep mode
- Reverse power protection to 50 W
- Simultaneous two tone generation
- Sine, triangular and square wave modulation source
- Modulation capabilities:
  - Amplitude, frequency, phase, pulse, FSK
  - Fast pulse modulation option
  - Soft front panel interface
  - VXI plug & play compatible
  - LabView and LabWindows drivers
  - -137 dBm to +25 dBm RF output

The 3002, with its wide frequency coverage from 9 kHz to 2.4 GHz internal modulation source and built-in attenuator, packs into only 2 C-sized VXI slots. It is not a signal source, but a fully fledged, high functionality signal generator. To ensure ease of use, the instrument has been designed to be fully compatible with the requirements of the IEEE 1155 specification and those of the VXI plug & play Systems Alliance. Software drivers and a simple ‘soft front panel’ interface allow the module to be easily programmed, with parameters changed via keyboard and mouse. The signal generator is suitable for a wide range of applications in the laboratory and production where an alternative to rack and stack systems is advantageous.

Operation
The 3002 is a message-based instrument and can be programmed using software drivers or by direct sending of ASCII strings to the instrument. Settings of frequency only, or of the full instrument, can be stored in memory allowing recall simply by memory number. Features which provide enhanced operation include non-volatile memories, memory sequencing and the use of VXI triggers for progressing test sequences.

Frequency selection
Frequency resolution of 1 Hz across the complete frequency range of 9 kHz to 2.4 GHz ensures adequate resolution to characterize narrow band communication systems and components.

RF Output
Output levels up to +25 dBm (+19 dBm above 1.2 GHz) can be set with a resolution of 0.1 dB over the entire range. An attenuator hold function allows control of the RF output without introducing RF level drop-outs from the step attenuator to facilitate testing of receiver squelch systems. Also included are five RF level offsets which enable the user to calibrate out any path losses or small gains up to 5 dB.

50 W Protection
An electronic trip protects the generator output against reverse power of up to 50 W from source VSWRs of up to 5:1, preventing damage to output circuits if an RF transmitter or DC power supply is accidentally applied to the output connector. This feature contributes to long service life and low cost of ownership.

Modulation
Comprehensive amplitude, frequency, phase, FSK and pulse modulation facilities are provided for testing all types of receivers.
Modulation Oscillator

An internal modulation oscillator is provided which is capable of generating one or two tones in the frequency range of 0.01 Hz to 20 kHz. An alternative to a sine wave output, a triangular or square wave output is provided. A front panel input enables an external modulation signal to be combined with the internal modulation to simplify the testing of complex receiver systems.

Frequency and Phase Modulation

With a 1 dB FM bandwidth of 100 kHz and a deviation range of 0 to 100 kHz, the 3002 signal generator offers wide frequency modulation capability. AC or DC coupled FM can be selected with very low carrier frequency error and drift in the DC coupled mode. The DC coupled mode is ideal for testing narrow band analog radios with a deviation range of 0 to 10 radians and a 3 dB bandwidth up to 10 kHz.

Amplitude and pulse modulation

Amplitude modulation with a 1 dB bandwidth of 30 kHz and modulation depths of up to 99.9% with a resolution of 0.1%, ensures the generator is suitable for testing AM systems and undertaking EMC immunity measurements. The pulse modulation facility has an on/off ratio of better than 45 dB up to 1.2 GHz and a rise time of less than 10 ns enabling characterization of TDMA or TDD bursts in RF amplifiers and modules.

An optional Fast Pulse modulator improves the on/off ratio to typically >80 dB with typically rise and fall times of 15 ns.

2 and 4 level FSK

In addition to the analog FM facilities, the 3002 signal generator allows the generation of 2 and 4 level FSK signals from external logic levels. The FM deviation generated is set by programmed command. The facility is ideal for testing paging receivers and RF modems.

Sweep

When configured as a swept carrier frequency generator, the start and stop frequency, step size and time per step can be programmed along with a choice of linear or logarithmic sweep. The sweep can be set to single or continuous operation and can be initiated by a command, a trigger applied to the front panel input or from the VXI backplane. A single step facility is also provided.

Size and weight

The 3002 occupies only 2 slots in a C-size chassis. This space saving is especially valuable in the testing of FDM links where large numbers of sources are required.

Spectral Purity

Measurement of receiver selectivity and ultimate signal to noise ratio requires good spectral purity. The 3002 has a low residual FM of typically 3 Hz and sideband noise of ~121 dBc/Hz at 1 GHz to allow demanding measurements to be made at an affordable cost.

Instrument stores

The 3002 signal generator provides extensive storage facilities for simplifying repetitive test scenarios. Up to 100 carrier frequency values and 100 complete instrument settings can be stored. All of these stores are non-volatile. A software protection system ensures that the stored settings cannot be accidentally overwritten. The use of an electronic storage medium without back-up batteries ensures long storage life and avoids periodic replacement of batteries. A large volatile storage system capable of storing 100 instrument settings is also provided for use by automatic test systems. The values can be downloaded and then recalled by stored number to avoid the time overhead introduced by the handling of the message based protocol of full instrument settings.

Sequencing

A software facility allows sequences of stored instrument settings to be defined. The trigger commands, front panel or backplane triggers, can then be used to cycle through the sequence of settings to give the highest throughput rates in automatic test systems.

Calibration Data

All alignment data, including the internal frequency standard adjustment, is digitally derived and realignment can be undertaken by protected functions and does not require the removal of instrument covers. Status information stored includes model type and serial number. An elapsed time facility allows the monitoring of the number of users’ hours the product has been in use. With a recommended calibration interval of 2 years, ownership costs are kept low.

Programming

The protocol and syntax of the standard commands have been designed in accordance with the IEEE 488.2 standard to simplify the generation of test programs.

To further assist in test program generation and debug, the current instrument setting and status can be read back.

Specification

General Description

The 3002 covers the frequency range 9 kHz to 2.4 GHz. The RF output can be amplitude, frequency, phase or pulse modulated. An internal synthesized programmable AF source is capable of generating single or two tone modulation.

Carrier Frequency

Range

9 kHz to 2.4 GHz

Resolution

1 Hz

Accuracy

As frequency standard

RF Output

Range

–137 dBm to +25 dBm (+19 dBm above 1.2 GHz) 0.1 dB resolution. When AM is selected the maximum RF output level decreases linearly with increasing AM depths to +19 dBm (+13 dBm above 1.2 GHz) at 99.9% depth.

RF Level Units

Units may be programmed in µV, mV, EMF or PD, dB relative to 1 µV, 1 mV EMF or PD, or dBm. The output level can be normalized for
75 Ω operation with an impedance converter

**Level Accuracy**

(over temp. range 17°C to 27°C)

**Attenuator Hold**

Selection of Attenuator Hold provides for uncalibrated level reduction of at least 10 dB without the Mechanical Attenuator operating

**VSWR**

For output levels less than –5 dBm, output VSWR is less than 1.3:1 for carrier frequencies up to 1.2 GHz and less than 1.5:1 for carrier frequencies up to 2.4 GHz

**Output Impedance**

50 Ω SMA female connector to MIL 390123D

**Output Protection**

Protected from a source of reverse power up to 50 W from 50 Ω or 25 W from a source VSWR of 5:1. Protection circuit can be reset remotely. Tripping the reverse power protection illuminates a front panel LED and causes an interrupt

**Spectral Purity**

**Harmonics**

Typically better than –30 dBc for RF levels up to +7 dBm

Typically better than –25 dBc for RF levels up to 6 dBm below maximum specified output

**Non-Harmonics (offsets > 3 kHz)**

Better than –70 dBc to 1 GHz

Better than –64 dBc above 1 GHz

Better than –60 dBc above 2 GHz

**Residual FM (FM off)**

Less than 4.5 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 1 GHz

**SSB Phase Noise**

Better than –124 dBc/Hz at 20 kHz offset from a carrier frequency of 470 MHz, typically –121 dBc/Hz at 20 kHz offset from a carrier frequency of 1 GHz

**ΦM on AM**

Typically 0.1 radians at 30% depth at 470 MHz

**Modulation Modes**

Internal and external modulation can be simultaneously enabled to allow combined amplitude and frequency (or phase) modulation. Pulse modulation can be used in combination with the other forms of modulation.

**Frequency Modulation**

**Deviation**

0 to 100 kHz, 3 digits or 1 Hz resolution

**Accuracy at 1 kHz**

±5%

**Bandwidth (1 dB)**

DC to 100 kHz (DC coupled)

10 Hz to 100 kHz (AC coupled)

20 Hz to 100 kHz (AC coupled with ALC)

**Group delay**

Less than 5 μs to 100 kHz

**Carrier frequency offset**

(AC coupled)

Less than 1% of the set frequency deviation

**Distortion**

Less than 3% at 1 kHz rate for deviations up to 100 kHz. Typically < 0.5% at 1 kHz rate for deviations up to 10 kHz

**Modulation source**

Internal LF generator or external via front panel BNC

**FSK**

**Modes**

2 level or 4 level FSK

**Data Source**

External data connected to Trigger input connector (2 level) or Trigger and Pulse input connectors (4 level)

**Frequency Shift**

Settable up to ±100 kHz

**Accuracy**

As FM deviation accuracy

**Timing Jitter**

±3.2 μs

**Filter**

8th order Bessel, –3 dB at 20 kHz

**Phase Modulation**

**Deviation**

0 to 10 radians, 3 digits or 0.01 resolution

**Accuracy at 1 kHz**

±5% of indicated deviation excluding residual phase modulation

**3 dB Bandwidth**

100 Hz to 10 kHz

**Distortion**

Less than 3% at 10 radians at 1 kHz modulation rate. Typically < 0.5% for deviations up to 1 radian at 1 kHz

**Modulation source**

Internal LF generator or external via front panel BNC

**Amplitude Modulation**

For carrier frequencies below 2 GHz

For RF levels below +18 dBm

**Range**

0 to 99.9%, 0.1% resolution

For the very latest specifications visit www.aeroflex.com
**Accuracy**

At 1 kHz modulation rate in the temperature range 17°C to 27°C
Temperature coefficient <0.02%/°C
For carrier frequencies <500 MHz
±5% of set depth
For carrier frequencies <2 GHz
±7.5% of set depth

**1 dB Bandwidth**

DC to 30 kHz (DC coupled)
10 Hz to 30 kHz (AC coupled)
20 Hz to 30 kHz (AC coupled with ALC)

**Distortion**

At 1 kHz modulation rate
For carrier frequencies below 500 MHz
<2.5% up to 80% depth
<1.5% up to 30% depth
For carrier frequencies between 500 MHz and 2 GHz
RF level <+7 dBm
<3.5% up to 80% depth
<1.5% up to 30% depth
RF levels +7 dBm to +18 dBm
<5% up to 80% depth
<2.5% up to 30% depth

**Modulation source**

Internal LF generator or external, via front panel BNC

**Resolution**

0.01 Hz for frequencies up to 100 Hz
0.1 Hz for frequencies up to 1 kHz
1 Hz for frequencies up to 20 kHz

**Frequency Accuracy**

As frequency standard

**Distortion**

Less than 0.1% THD at 1 kHz

**Waveforms**

Sine wave to 20 kHz and triangular or square wave to 3 kHz

**Audio Output**

The modulation oscillator signal is available on a front panel BNC connector at a level of 2 V RMS EMF from a 600 Ω source impedance

**External Modulation**

Input on the front panel via BNC connector. The modulation is calibrated with 1.414 V peak (1 V RMS sine wave) applied. Input impedance is 100 kΩ nominal.

**Modulation ALC**

The external modulation input can be levelled by a peak levelling ALC system over the input voltage range of 0.75 V to 1.25 V RMS sine wave. High and low indications are reported as part of the instrument status when the input is outside the levelling range.

**Sweep Mode**

Control Parameters

- Start/stop values of carrier frequency, size of step and time per step

**Sweep Time**

50 ms to 10 s per step

**Linear Sweep**

- Frequency step size of 1 Hz minimum

**Logarithmic Sweep**

- Percentage increment of 0.01% to 50% in 0.01% steps

**Sweep Mode**

- Single, continuous or external trigger

**Trigger**

A trigger input is available on a front panel BNC. A step or the complete sweep may be triggered by the front panel input, VXI backplane trigger or VXI command.

**Frequency Standard**

**TCXO**

- 10 MHz

**Temperature Stability**

- Better than ±7 in 10⁷ over the operating range of 0 to 55°C

**Ageing Rate**

- Less than ±1 in 10⁶ per year

**Internal LF Generator**

**Frequency Range**

0.01 Hz to 20 kHz
External input

Front panel BNC connector accepts an input of 1 MHz or 10 MHz at 220 mV RMS to 1.8 V RMS into 1 kΩ.

General

VXI-bus INTERFACE CAPABILITIES

Complies with revisions 1.3 and 1.4 of the VXIbus specification for message based instruments

Logical address

Manual selection (1-254)

Device type

A16 D16 message based servant, programmable interrupter

Protocol

Word serial IEEE 488.2

Fast Handshake not supported

Connectors

P1, P2 (highest slot of a 2 slot allocation)

TTLTRG

Used to trigger sweep mode and step memory sequences

CLK10

Total Power 60 W max

Cooling (per slot): 2.4 litre/s at 1 mm H₂O back pressure for 10°C maximum temperature rise

BITE (built-in test equipment)

LEDs or modules front panel indicate Power OK (green), System Failure (red) and Reverse Power Protection Tripped (red)

RFI COMPATIBILITY

Complies with VXIbus revision 1.3/1.4 specifications below 1 GHz

ELECTROMAGNETIC COMPATIBILITY

Conforms with the protection requirements of the EEC Council Directive 89/336/EEC. Conforms with the limits specified in the following standards:

IEC/EN61326-1 : 1997, RF Emission Class B, Immunity Table 1, Performance Criteria B

SAFETY

Conforms with the requirements of EEC Council Directive 73/23/EEC (as amended) and the product safety standard IEC/EN 61010-1 : 2001 + C1 : 2002 + C2 : 2003 for class 3 portable equipment, for use in a Pollution Degree 2 environment. The instrument is designed to be operated from an Installation Category 1 supply.

CONDITIONS OF STORAGE AND TRANSPORT

Temperature

-40 to +70°C

Humidity

Up to 93% at 40°C

Altitude

Up to 3050 m (10,000 ft)

CONDITIONS OF STORAGE AND TRANSPORT

Temperature

-40 to +70°C

Humidity

Up to 93% at 40°C

Altitude

Up to 4600 m (15,000 ft)

CALIBRATION INTERVAL

2 years

DIMENSIONS AND WEIGHT

Dimensions 2 slot, C Size

Weight Less than 4 kg

OPTION 11 - FAST PULSE MODULATOR

Specification as standard instrument with the following exceptions.

Frequency Range

100 kHz to 2.4 GHz (useable to 9 kHz)

RF Output Range

As standard instrument with the exception that maximum output level is reduced by 3 dB when Pulse is selected.

RF Level Accuracy

Additional ±0.01 dB/°C temperature coefficient when pulse enabled Adds ±0.25 dB for for carrier frequencies below 10 MHz

On/Off Ratio

>80 dB below 1.2 GHz

>70 dB up to 2.05 GHz (typically >80 dB)

>65 dB up to 2.4 GHz (typically >70 dB at 2.4 GHz)

Rise & Fall Times

<20 ns (typically 15 ns)

Maximum Repetition Frequency

10 MHz

Control

50 Ω input impedance. A logic 0 (0 V to 0.8 V) turns the carrier off, Maximum input is ±10 V

FSK Modulation

Only 2 level FSK available when Option 11 specified.

For the very latest specifications visit www.aeroflex.com

As we are always seeking to improve our products, the information in this document gives only a general indication of the product capacity, performance and suitability, none of which shall form part of any contract. We reserve the right to make design changes without notice. All trademarks are acknowledged.

Our passion for performance is defined by three attributes represented by these three icons:

solution-minded, performance-driven and customer-focused.
Signal Sources

Option 5  GSM PCN PCS

Generates GMSK modulation to the GSM, DCS1800 standards and PCS standards, allowing internal data to be easily entered and edited for mobile phone, base station and component testing.

- Wideband cover:
  - 10 MHz to 1.35 GHz (2030)
  - 10 MHz to 2.7 GHz (2031)
  - 10 MHz to 5.4 GHz (2032)
- GMSK Bt 0.3 Modulation
- Internal data generator
- Data editor
- External data / clock modulation
- Excellent phase accuracy
- Wideband FM

**Internal Modulation**
An internal data generator can be used to modulate the carrier. The data can be entered and edited at bit level within a slot and the stored slots assembled into frames, multiframes and superframes either from the keyboard or from an external GPIB controller. Null and pseudo random data slots are also available.

**External Modulation**
An external source of data and 270.833 kHz clock can be used. The data is internally filtered to provide GMSK Bt 0.3 modulation and the RF envelope can be set to be externally controlled. In this mode the generator frequency standard is phase locked to the external clock signal.

**Store and Recall**
The availability of non-volatile stores ensures that internal data can be stored for future use and simplifies stand alone operation. The internal data can be edited to bit level within a slot and slots can be assembled into frames, multiframes and superframes.

**SPECIFICATION**

**GENERAL DESCRIPTION**
This option adds GMSK (Gaussian Minimum Shift Keying) modulation at a bit rate of 270.833 kHz to the 2030 series. This modulation is used by the GSM and UK PCN systems.

Front panel connectors provide external modulation inputs for Clock, Data and Envelope control.

Facilities are provided for internal modulation by data sequences which can be internally edited and stored. The front panel connectors provide outputs for Clock and Data.

Instruments may be connected using the SYNC connectors to provide multiple RF Outputs with synchronized slot and frame structures.
2030, 2031 or 2032 Signal Generators fitted with the GMSK option conform to the 2030 series specification in the GMSK mode except as follows:

**CARRIER FREQUENCY RANGE**

<table>
<thead>
<tr>
<th>Model</th>
<th>Frequency Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>2030</td>
<td>10 MHz to 1.34675 GHz</td>
</tr>
<tr>
<td>2031</td>
<td>10 MHz to 2.69675 GHz</td>
</tr>
<tr>
<td>2032</td>
<td>10 MHz to 5.4 GHz*</td>
</tr>
</tbody>
</table>

*(GMSK modulation limited to 10 MHz - 2.7 GHz)*

**RF OUTPUT**

<table>
<thead>
<tr>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 dBm to –144 dBm</td>
</tr>
</tbody>
</table>

(-3 dBm max with Option 12 Electronic Attenuator)

**Accuracy**

2 dB

**Output VSWR**

As for 2030 series for levels below –6 dBm

**SPECTRAL PURITY**

**Non-Harmonic Output**

GMSK signals are generated by mixing a local oscillator with a 3.25 MHz IF signal carrying the GMSK signal. Additional signals are present at the local oscillator frequency, image frequency and frequencies equivalent to the harmonics of the IF mixed with the local oscillator.

**FREQUENCY STANDARD**

In GMSK mode an input or output at 13 MHz, 10 MHz, 5 MHz or 1 MHz is available.

**GMSK MODULATION**

**Modulation Type**

GMSK Bt 0.3 to GSM recommendation 0.5.04.

**Modulation Accuracy**

Phase accuracy as defined by GSM 05.05 – 4.6 is 1° RMS, 3° peak for carrier frequencies up to 1 GHz.

A second Bt is available which gives an RMS phase error of 5°.

**DATA CODING**

Selectable as uncoded, or differentially coded to GSM rec 05.04 – 2.3 for internal or external modulation.

**INTERNAL MODULATION**

An internal data source provides a Traffic Channel format superframe hierarchy.

Individual slots may be null data, fixed data, or contain (229–1) PRBS data as defined in CCITT rec V52. Successive slots contain 156, 156, 156, and 157 bits. The internal data source provides data and clock output. Internal data can be edited from the front panel and stored or can be entered using the GPIB.

The RF envelope may be ramped up and down to GSM 05.05 annex 2 and GSM 05.05 – 4.2.2.

The internal data generator can be used with an external clock as in ‘External Modulation’.

**EXTERNAL MODULATION**

Clock and Data input at TTL compatible levels. Data must be valid on the falling edge of the clock input.

**Data Input level**

TTL compatible

**Clock Input level**

TTL compatible

**Clock Input frequency**

270.833 kHz ±25 ppm or a clock of the same bit rate but including one clock period of 1¼ bits per slot.

**Envelope Input Impedance**

15 kΩ nominal

**Doppler FM Input Impedance**

50 Ω

**ENVELOPE CONTROL**

Selectable constant level, internal level control, or controlled from the external envelope input: External envelope control voltages are 0 V for off, +1 V for specified RF level. The RF output voltage varies linearly with applied voltage.

**External Input risetime**

Less than 4 μs.

**Off Slot Suppression**

Better than –70 dBC.
**MODULATION SENSE**

Output can be set to use upper or lower sideband. Modulation sense can be inverted.

**Synchronization**

Instruments may be synchronized by use of the Sync Input/Output. One instrument in MASTER mode sources a bit clock and the SYNC signal. The SYNC signal goes active low for one bit during the transition of the internal data from slot 7, bit 156 to slot 0, bit 0. Instruments in SLAVE mode use Clock and SYNC signals to maintain a synchronized data structure.

**Synchronization input/output**

Open collector TTL, 2 mA pull-up, active low, bidirectional.

---

**VERSIONS AND ACCESSORIES**

When ordering please quote the full ordering number information.

**Ordering Numbers**

**Versions**

- **2030** 10 kHz to 1.35 GHz Signal Generator.
- **2031** 10 kHz to 2.7 GHz Signal Generator.
- **2032** 10 kHz to 5.4 GHz Signal Generator.
- **Option 005** GSM PCN PCS (GMSK Bt 0.3).

**Supplied with**

- AC power lead
- Operating Manual

**Options**

- **Option 001** Second internal modulation oscillator.
- **Option 002** Pulse Modulation.
- **Option 003** 19 dBm Output (2030 only).
- **Option 006** Avionics (requires Option 001, cannot be ordered with Option 003).
- **Option 008** RF Profiles and complex sweep.
- **Option 012** Electronic Attenuator (2030 and 2031 only). Not available with options 003 or 010.
- **Option 105** Modifies the pulse modulation option for slower rise and fall times (order with Option 002).
- **Option 112** External modulation inputs (2) 600 Ω impedance

**Note**

Option 5 is not available with option 9 or option 10 or on 2040 and 2050 series.
As we are always seeking to improve our products, the information in this document gives only a general indication of the product capacity, performance and suitability, none of which shall form part of any contract. Signal Sources

Option 6 Avionics Signal Generator (2030/40/50 series)

Option 6 is available for all 2030, 2031, 2032, 2040, 2041, 2042, 2050, 2051 and 2052 signal generators have become the solution of choice for testing avionics receivers. It offers a range of high performance signal generators for the testing of ILS, VOR and aircraft communications systems. For bench testing of navigation receivers the 2030 series provides exceptional accuracy, allowing even high performance receivers used for airfield alarm monitors to be tested with confidence. The 2040 series signal generators offer the same high levels of performance with the added advantage of exceptionally low carrier phase noise to allow the rigorous testing of the receiver selectivity and intermodulation, an important factor in today’s crowded spectrum for a safety critical industry.

The 2050 series has the same performance as the 2030 series but with the additional benefit of being able to provide digitally modulated carriers.

All models can be supplied with a fast pulse modulator and the 2030 series can be supplied with an internal pulse generator to aid radar testing. A further option for 2030 series is a DME option which allows the signal generator to provide Gaussian shaped double pulse for DME testing.

ILS

In ILS mode, the Sum of Depth of Modulation (SDM) of the 90 Hz and 150 Hz tones can be entered to a resolution of 0.1% AM depth. The Difference in Depth of Modulation (DDM) is entered to a resolution of 0.01% depth for a DDM up to 20% and 0.1% for higher DDM settings. A choice of which tone is dominant is available to the user.

The 30 Hz repetition frequency of the ILS waveform can be adjusted in 0.1 Hz steps. For 0% DDM, additional modulation signals can be added to the ILS waveform.

Accurate ILS and VOR RF waveforms
Wide frequency coverage
SELCAL calling tones
Internal ILS and VOR waveform generators
0.0001 DDM resolution
0.01% bearing resolution
Marker beacon
Optional pulse modulation
Automatic direction finder testing
Comprehensive memory facilities

The Aeroflex family of Avionics Signal Generators provides internal generation of waveforms suitable for testing Instrument Landing Systems (ILS), VHF Omni-directional Radio Range (VOR) systems, Marker Beacons and SELCAL radio receivers. Avionics parameters are presented in the same form as described in the ICAO standards. The family offers an ideal single instrument solution for the testing of avionics receivers and airfield alarm monitors. The use of Direct Digital Synthesis techniques ensures excellent accuracy and stable performance under all operating conditions.
Changing between localizer and glide-slope operation is accomplished with a single key stroke.

**Marker Beacons**

In the Marker Beacon mode, signals are generated simulating the outer, middle and inner marker beacons. A single key press selects which marker beacon is simulated. Carrier frequency, modulation depth and modulation frequency can be varied from the default settings. Using the normal calling tones menu enables pulsed marker beacon modulation signals to be generated.

**VOR**

In VOR mode, the AM depth of the subcarrier and 30 Hz tone can be independently set and the relative phase of the 30 Hz tone and the modulation tone on the subcarrier is set by directly entering the bearing information in degrees. The VOR repetition rate of 30 Hz can be adjusted in 0.1 Hz steps. For a fixed bearing, additional modulation can be applied to simulate voice/identity signal. A To/From Beacon key provides a rapid means of reversing a bearing entry and accounting for different bearing conventions.

**SELCAL**

SELCAL selective calling tone signals are used on the radios providing communication between the aircraft operator and the flight crew. The Avionics Signal Generator provides facilities for generating the SELCAL codes and the modulation signals to test the radio receiver.

**Simple Operation**

Major parameters can be adjusted by keyboard entry of data, using the UP/DOWN keys or using the rotary control. The use of a large screen dot matrix display ensures clear and unambiguous readout of the avionics parameters.

Instrument settings can be stored in nonvolatile memories. A sequence of test settings can be stored and, using the external trigger facility, the currently recalled memory can be incremented to step through the stored test sequence.

The power up sequence of the generator can be defined such that it always switches on in avionics mode.

---

**SPECIFICATION**

Specifications are as 2030, 2031, 2032, 2040, 2041, 2042, 2050, 2051 or 2052 with the following additions

**ILS MODE**

**Tone Frequencies**

90 Hz, 150 Hz nominal. Tone frequency may be changed by varying the ILS repetition rate of 30 Hz in 0.1 Hz steps. Tone frequencies maintain 3:1 and 5:1 relationships with the ILS rate.

**Frequency Accuracy**

As frequency standard

**Tone Suppression**

Either tone can be suppressed

**Additional Modulation**

Available for 0% DDM from an internal or external modulation source

**Sum of Depth of Modulation (SDM)**

**SDM Range**

0 to 99.9% in 0.1% steps representing the arithmetic sum of each tone depth

**SDM Selection**

By keyboard entry of data and variation by UP/DOWN keys or rotary control

**RF Accuracy of SDM**

±2% of SDM setting for carrier frequencies up to 400 MHz (from 100 MHz to 400 MHz with Option 12)

At 40% SDM accuracy is ±0.8% depth

At 80% SDM accuracy is ±1.6% depth

**Difference in Depth of Modulation (DDM)**

**DDM Range**

0 to 20% in 0.01% steps

20 to 99.9% in 0.1% steps

**DDM Selection**

By keyboard entry of depth in %, mA or index and variation by UP/DOWN keys or rotary control

**RF Accuracy of DDM**

±0.02 of DDM setting ±0.0003 DDM (0.03% depth)

At 0 DDM (on course) accuracy is ±0.0003 DDM (0.03% depth)

At 0.155 DDM accuracy is ±0.0034 DDM (0.34% depth)

**LF Output**

Available from the LF Output connector

**LF Accuracy of DDM**

Equivalent to ±0.0003 DDM ±0.005 of setting

At 0 DDM (on course) accuracy is ±0.0003 DDM

**MARKER BEACON MODE**

Provides default carrier of 75 MHz, 95% AM depth and a modulation frequency of 400 Hz, 1.3 kHz or 3 kHz corresponding to Outer, Middle and Inner Markers. Carrier frequencies, AM depth and modulation frequency can be adjusted from the default values.
VOR MODE

Selection
By keyboard entry of depth and variable by UP/DOWN keys and rotary control

Bearing Control
Relative phase of 30 Hz tone and subcarrier modulation adjustable from 0° to 359.9° in 0.01° steps by entering VOR bearing. Bearing can be entered as TO or FROM the beacon.

Bearing Accuracy
±0.05°

Additional modulation
Available on 0° bearing from an internal or external modulation source

AM Depth Accuracy
±3% of setting ±0.5% for carrier frequencies up to 400 MHz (from 100 MHz to 400 MHz with Option 12)

Frequency
The VOR repetition frequency of 30 Hz may be varied in 0.1 Hz steps. The subcarrier frequency and deviation maintain a fixed relationship with the VOR repetition rate

Frequency Accuracy
As frequency standard
9.96 kHz subcarrier

AM Range
0 to 49.9% depth in 0.1% steps

Modulation
Frequency modulated by a 30 Hz tone with settable deviations of 420 Hz, 450 Hz, 480 Hz, 510 Hz and 540 Hz

30 Hz Tone
AM Range
0 to 49.9% depth in 0.1% steps

Arithmetic sum of 30 Hz tone and sub carrier limited to 99.8%

ADF MODE

(Does not apply with Option 12 fitted)
Provides default carrier of 190 kHz with 30% AM depth at 1 kHz rate. Carrier frequency, AM depth, modulation rate and RF level can be varied from the default values.

SELCAL MODE

Provides a facility for modulating the RF carrier with sequential calling tones defined by the SELCAL protocol. Allows the entry of two character pairs to define the SELCAL code generated to open the audio path of aircraft radios. Default tone duration and gap are 1 s and 250 ms respectively and can be varied from nominal values.

VERSIONS AND ACCESSORIES

For the full Signal Generator performance specifications please refer to the 2030/40/50 signal generator datasheets. When ordering please quote the full ordering number information.

The NAV-750C is functionally identical to 2030 1.35 GHz Signal Generator fitted with Option 1 and 6.

Option 6 Avionics Signal Generator

Ordering Numbers
To order an avionics signal generator specify which model is required and order with Option 1 and Option 6 fitted.

Signal Sources 2030/40/50 Series

Option 8 RF Profile & Complex Sweep

Ability to offset for insertion loss or gain of external devices, and provides complex carrier sweeps. Particularly useful for EMC testing and for ATE applications.

- Calibration of RF power at a remote connector
- Frequency dependent RF output power
- Complex sweep capability
- 20 ms to 20 s step time
- Sine, triangle and square wave modulation

Option 8 RF Profile and Complex Sweep provides additional software features which are particularly well suited for Electromagnetic Immunity, Tempest testing and other applications using signal generators with external devices which introduce frequency dependent RF level errors.

Careful attention to transient states ensures that positive overshoots that could damage power amplifiers are not generated.

RF Profile and Offset

The RF Profile and Offset facility allows the user to reduce RF level errors introduced by using external amplifiers, attenuators or signal combiners. The signal generator accepts and displays RF level requests for the power referred to the output of the external device. The facility reduces the calibration effort required in ATE systems and minimizes the probability of operator induced errors when performing manual tests. The RF Profile facility allows the entry of 10 profiles containing up to 100 correction points with linear interpolation to minimize the RF level frequency response errors introduced by the external device.

The use of a large LCD panel and a flexible menu driven user interface provides a simple means of rapidly generating, selecting and editing profiles in an intuitive way whilst minimizing any ambiguity in the setting of the generator.

Segmented Sweep

The Segmented Sweep facility allows the generation of sweeps with up to 10 segments, each of which can have independent sweep parameter settings. The ability of each segment to have a different RF level permits swept immunity tests to be undertaken which follow the frequency dependent immunity limits specified in EMC standards. The independent frequency step size allows the sweep speed to be increased at higher carrier frequencies to minimize the test time.

The independent stop and start frequencies for adjacent segments also allows the generation of sweeps which deliberately omit sections of the RF spectrum to test systems with on-line signals or to speed up tests on multiband systems.

The sweep can be halted at any time if a device response is obtained and the signal generator settings can then be varied to explore the
device response before then continuing with the sweep from the point
where the sweep was halted.

Programmable frequency step times between 20 ms and 10 s com-
bined with frequency step sizes down to 0.1 Hz allow the generation
of fast swept signals or the slow sweeps associated with EMC testing.

**Complex Sweeps**

The segmented sweep can be combined with the RF Offset and RF
Profile facility to produce complex sweeps which manipulate the RF
output level of the signal generator to correct for the frequency
response of amplifiers, cables, combiners and antenna characteris-
tics. The ability to include correction factors in sweep mode allows
the signal generator to be used in computer controlled test system
which allow for manual intervention of the test without losing the sys-
tem calibration information.

The use of the extended hysterisis facility with the sweep facility to
minimize the number of attenuator level transients during a swept
test is particularly useful for testing devices which are susceptible to
large rapid changes in RF level.

**Options**

The Option 8 software is available on all versions of the
2030/40/50/50T series signal generators and can be combined with
the second modulation oscillator, pulse modulation and generation,
GSM PCN and Avionics options to provide a flexible signal generator
capable of undertaking tests on most RF and receiver systems.

**SPECIFICATION**

**GENERAL DESCRIPTION**

Option 8 software provides additional sweep, RF offset and RF level
profiling facilities to support the use of 2030, 2040A 2050 and 2050T
series Signal Generators with external amplifiers and attenuators. The
RF output from the external device can be calibrated and displayed on
the front panel of the signal generator using the RF Offset and RF
Profile facilities.

**RF OFFSETS**

Displayed signal generator output level can be offset by +80 dB to
–40 dB from the actual RF output level.

RF Offsets may be used in normal signal generator modes or combined
with segmented sweeps.

**RF PROFILE**

RF output level can be adjusted by ±40 dB from its nominal value
without changing the displayed RF output level. Ten profiles can be
created each containing up to 100 correction points and the RF output
level is linearly interpolated between correction points.

RF Profiles can be used in normal signal generator modes or combined
with the segmented sweep.

**SEGMENTED SWEEP**

Carrier frequency sweeps can be generated which contain defined seg-
ments each of which can have a different step size, start and stop fre-
quency, step time and RF level.

Sweep facility is available for 2030 and 2050(T) series in analog
modes and for 2040 series in Normal Noise mode.

Signal Sources 2030 Series

Option 9 Internal Pulse Generator

- Programmable pulse parameters
- External trigger function
- Single and double pulse
- Variable pulse repetition frequency
- Variable pulse delay
- Variable pulse pair spacing
- Variable pulse width
- Wide carrier frequency range
- On/Off ratio of 80 dB
- Eliminates need for external pulse generator

Option 9 Pulse Generator provides the user with internally generated single or double pulses. When combined with Option 2, Pulse Modulation, a solution is provided to aid the testing of radars, EMC or TDMA systems.

The pulse generator can be used with FM, PM and wideband FM or with unmodulated carriers.

With the Pulse Generator allowing variable control of the pulse parameters, many different types of systems can be efficiently and easily evaluated.

Simple Interface

Parameters can be adjusted by keyboard entry of data or by using the 9-5 keys. The use of a large screen dot matrix display ensures clear and unambiguous readout. Within each display, soft keys are assigned alongside the display to allow parameter entry or to select the relevant functions.

Pulse Generator

With Options 2 and 9 combined, single and double pulsed RF carrier outputs can be generated. Pulse width can be varied from 50 ns to 100 ms. Pulse delays can be set from 1 µs to 100 ms in single trigger mode and pulse pair spacing can varied from 100 ns to 100 ms. Triggering can be continuous or via an external source. See Figures 1 and 2 for more details.

The pulse generator with Option 2 can be used over the entire frequency range of the 2030 series, with the level range of -144 dBm to +13 dBm.

Output Control

Synchronization and video outputs are available on rear panel BNC connectors. SYNC provides a 400 ns pulse indicating the start of the pulse. VIDEO provides square waves with fixed rise and fall times and variable parameters such as pulse delay, width and repetition rate.
SPECIFICATION

Specifications remain as standard 2030 series with the following additions.

OPTION 9 INTERNAL PULSE GENERATOR

VIDEO OUTPUT (REAR PANEL BNC)

Pulse Width(s)
50 ns to 100 ms, resolution 50 ns

Repetition Rate/Period (internal trigger)
1 µs to 100 ms, resolution 50 ns

Pulse Delay (Single or Double pulse)
1 µs to 100 ms, resolution 50 ns

Double Pulse Pair Spacing
100 ns to 100 ms, resolution 50 ns

Level
Pseudo TTL (Typ. 0 to 4.5 V, 0 to 2.5 V into 50 Ω)

Rise/Fall Time
Less than 5 ns

EXTERNAL TRIGGER (PULSE INPUT)

Characteristics
Rising edge, TTL level into 50 Ω
Min. Pulse Width 10 ns

Trigger to SYNC Delay
Less than 50 ns

Trigger to SYNC Jitter
Typically 25 ns

RF OUTPUT (WITH OPTION 2 FITTED)

Level Range
-144 dBm to +13 dBm overrange to +19 dBm uncalibrated

Accuracy
Additional level error of ±0.5 dB

Modulation Modes
Pulse modulation may be used at the same time as FM, PM or wide-band FM.

Pulse Characteristics
As above, except:

Rise/Fall Time
Typically <25 ns

ON/OFF Ratio
Better than 70 dB, typically better than 80 dB

Signal Sources
Option 10 DME Avionics

Ideal for testing the receiver stages of DME transponders using Gaussian shaped pulses used under operational conditions

- Generates DME Gaussian shaped double pulses
- Variable pulse parameters
- Gaussian pulse spectrum
- Sync and Video outputs
- External trigger input
- Simple user interface with large screen
- GPIB programmable
- VOR/ILS/Marker Beacons with option 6

DME (Distance Measuring Equipment) provides aircraft with accurate and continuous information of their slant range distance from a ground reference point. Option 10 on the 2030 series signal generators produce the necessary signals required to test DME transponders. The option consists of two parts - an internal pulse generator to produce double pulses, and a linear RF modulator which produces the required Gaussian shaping with 90% of the transmitted energy within a bandwidth of 0.5 MHz in accordance with EUROCAE ED57. Front and rear panel connectors provide External Trigger input and Synchronization and Video outputs.

Simple Interface
Major parameters can be adjusted by keyboard entry of data, using the UP/DOWN keys or the rotary control. The use of a large screen dot matrix display ensures clear and unambiguous readout of the avionics and DME parameters.

DME Pulse Generator
This provides Gaussian shaped double pulses with variable control of pulse width, rise and fall times, pulse pair spacing and pulse repetition rate thus giving complete flexibility when defining the pulse profile. Continuous internally or externally triggered modes of operation are available with all parameters adjustable in both cases.

DME Pulse Modulator
The Gaussian shaped double pulses from the generator can be used to modulate an RF carrier over the DME transmitter range of 960 MHz to 1215 MHz. Unlike a standard pulse modulator where the carrier is enabled or disabled by the modulating signal, the DME modulator is able to control the level of the RF signal at any particular time and thus produces a constrained spectrum corresponding to various standards including EUROCAE ED57 for DME. The Gaussian shaped pulses are identical in amplitude and shape with
level accuracy of ±0.5 dB over the range -110 dBm to +10 dBm.

**Memory**

All the instrument configuration settings can be stored within non-volatile memory locations. These memories can be triggered via an external input or manually from the front panel in order that a test sequence may be quickly recalled.

**Output Control**

There are two additional outputs provided, SYNC and VIDEO. The SYNC output is available either with internally generated pulses or external trigger. The VIDEO output is the same Gaussian shaped signal that is applied to the RF modulator.

---

**GPIB Programmable**

All functions can be controlled over the interface bus and are GPIB IEEE 488.2 compatible.

**Option 6 - Avionics**

DME Option 10 is a natural complement to existing Avionics option 06 which includes VOR, ILS, Marker Beacons, ADF and SELCAL.

The Avionics option offers a complete test solution for the maintenance of avionics radio receivers by providing modes of operations suitable for testing ILS and VOR systems. In addition, it provides efficient testing of marker beacons, SELCAL receivers and ADF (Automatic Direction Finders).

In conjunction with the Avionics option, the 2030 series offers a simple solution which is particularly well suited for testing the complete avionics system - surveillance, alarm monitors and receivers. Direct digital synthesis techniques ensure excellent precision and stability.

---

**SPECIFICATION**

Specifications remain as standard 2030 series with the following additions.

**RF OUTPUT**

**Frequency Range**

960 MHz to 1215 MHz

**Level Range**

-110 dBm to +10 dBm

**Absolute Level Accuracy**

Standard level error ±0.5 dB

**Pulse Pair level Accuracy**

±0.5 dB

**ON-OFF Ratio**

>80 dB

**VIDEO OUTPUT (REAR PANEL BNC)**

**Pulse Characteristics**

Double pulses, Gaussian shaped

**Pulse Width**

2.50 µs to 8.00 µs, resolution 50 ns

**Rise Time**

0.80 µs to 5.75 µs, resolution 50 ns

**Fall Time**

1.50 µs to 5.75 µs, resolution 50 ns

**Pulse Pair Spacing**

9.00 µs to 45.00 µs, resolution 50 ns

**Repetition Rate**

10 pp/s to 6000 pp/s

**Level**

Pseudo TTL (Typically 0 to 4.5 V, 0 to 2.5 V into 50 Ω)

**SYNC OUTPUT (REAR PANEL BNC)**

**Pulse Width**

Typically 400 ns

**Level**

TTL (Typically 0 to 4.5 V, 0 to 2.5 V into 50 Ω)

**Rise/Fall Time**

Typically 5 ns

**EXTERNAL TRIGGER (PULSE INPUT)**

**Characteristics**

Rising-edge, TTL level into 50 Ω

Min. pulse width 2 ns

**Trigger to SYNC Delay**

Typically 60 ns

**Jitter**

Typically 25 ns

Signal Sources
Option 12 SINAD Measurement (2023A/B, 2025)

Option 12 further enhances the versatility of the 2023A/B, 2025 range providing a complete receiver sensitivity test solution in an economical, space saving package.

- High performance SINAD measurement
- 50 dB measurement range
- Accurate DSP based CMESS, CCITT P53 and un-weighted filters
- RS-232 and GPIB control
- User selectable measurement averaging
- Simple menu set up
- Over/under range indication

Option 12 provides the user with a high performance SINAD measurement function which can be used for receiver testing in development, production and servicing.

The SINAD function can be used independently of the signal source as a genuine second instrument. Alternatively the SINAD measurement can be operated with the source in manual or automatic control of RF level mode.

Simple Operation
Set up of the measurement selections from a utility menu ensures simple and fast operation.

2023A/B and 2025 simultaneously displays the signal RF source parameters and the SINAD measurement result. The user is able to manually control the source amplitude and frequency and see at a glance the resulting SINAD. Input level over range and under range warning messages confirm valid measurement values.

Automatic RF Level Coupled Operation
An automatic RF level adjustment mode to achieve a user defined SINAD value for a receiver under test is available for even simpler bench operation. In this mode the RF level is automatically reduced from a pre-set level until the measured SINAD value matches the user input value.
Weighting Filters
SINAD measurements can be made un-weighted or through accurate and stable DSP based CMESSAGE or CCITT P53 psophometric weighting filters.

Result Averaging
A user selectable result averaging function in the range 1-127 can be applied to the displayed SINAD result.

Instrument Stores
The extensive volatile and non-volatile storage facilities on 2023A/B and 2025 are available for use with Option 12 SINAD to simplify repetitive test sequences for manual or GPIB operation.

**SPECIFICATION**

**GENERAL DESCRIPTION**
This option provides an independent high performance SINAD measurement function featuring 50 dB SINAD measurement range, with automatic over/under range indication, user selectable weighting filters and result averaging. An automatic generator level seek mode from a user SINAD input value is included. Available with all existing 2023A/B and 2025 family options.

**MEASUREMENT RANGE**
50 dB

**ACCURACY**
±0.5 dB

**DISPLAY**

Resolution
0.01 dB

Averaging
User selectable result averaging from 1-127 measurements - Default setting is 5 measurements.

Over/under range indication
Automatic display warning when input signal level is out of range.

**INPUT SIGNAL**

Weighting Filters
Selectable CMESS, CCITT P53 weighted measurement filters or un-weighted measurement (50 Hz - 7.0 kHz 3 dB bandwidth)

Modulation Frequency
1 kHz ±20 Hz notch filter range

Sensitivity
50 mV RMS - 3.0 V RMS (250 mV RMS for 50 dB SINAD). Max. safe input level ± 15 V

Input Impedance
100 kΩ (nominal)

Input Connectivity
SINAD baseband input is via front panel Ext Mod Input connector, (MOD I/O connector when option 7 or 11 are fitted).

Signal Sources
Option 118 Fast Pulse Modulator 2026A

Option 118 Fast Pulse Modulator extends the application of 2026A 2 and 3 source signal generators to the testing of IFF radar and ECM receivers.

- Two or three high quality RF signal generators in a space efficient format
- Fast pulse capability, typically 15 ns rise and fall times
- Wide frequency coverage: 10 kHz to 2.05 GHz (2026A)
- +24 dBm RF output for effective component testing
- Support for an external signal generator
- User defined tracking between signal sources
- Adjustable carrier phase
- Built-in switched combiner network improves measurement uncertainty

The 2026A with Option 118 retains all the functionality of standard 2026A/B family including application modes. For a full product description refer to the 2026A/B family datasheet.

Measurement Accuracy
The use of a built in combiner, switches and cables eliminates many of the measurement uncertainties introduced by connecting together separate signal generators.

All alignment processes, including the internal frequency standard and the correction factors for the signal source RF paths, are digitally derived so realignment can be undertaken without removal of external covers. Digital adjustment also eliminates the use of mechanical adjusters, minimizing long term drift and vulnerability to mechanical shock.

Flexible Source Routing
Each of the signal sources can either be routed to a separate output connector or switched to the input of an RF combiner network before being fed to the combiner output connector. The combiner routing is set up quickly and effectively using the Combiner Set Up menu. The flexibility of the signal routing allows the 2026A/B family to accept an external signal generator, such as the 2050 Digital and Vector Generator, to enable different forms of carrier signals to be produced. Alternatively the output from a 2029 Vector Modulator, driven from one of the 2026A/B sources, can be routed in.

Setting up the source and combiner routing
Automatic Source Coupling

The 2026A with Option 118 allows the frequency and level of the internal RF sources to be coupled together with a user defined offset. The source frequencies can have an offset with an additional harmonic (or sub-harmonic) relationship to simplify the testing of harmonic converters and divider systems.

The coupling factors are entered by an easily understood format using a dedicated coupling menu.

Setting up coupling

The ability to set sources to track each other greatly simplifies the testing of mixers, multipliers and dividers by reducing the number of active controls required.

Sweep

The 2026A with Option 118 allows one of the RF sources to be frequency swept with user defined start, stop and step values to reduce the amount of operator time or GPIB overhead. By enabling the coupling facility, sweeping one source will simultaneously sweep the other internal RF sources to allow automated swept measurements on frequency conversion devices to be made.

The sweep can be performed with modulation enabled for swept measurements of receiver immunity characteristics.

High RF Output

The high RF level of the individual outputs is ideal for testing components and ensures that the 2026A with Option 118 can generate high RF levels at the combiner output.

Comprehensive Modulation

Each signal source is capable of being independently modulated from its own fully programmable modulation source to ensure maximum flexibility. The internal modulation sources are each capable of generating sine, triangle or square wave signals.

Amplitude, frequency and phase modulated carriers can be generated from the internal modulation sources or from the independent external inputs. The frequency modulation system provides excellent performance in the DC coupled mode with very low carrier frequency error and stability ensuring that the generator can accurately test receivers sensitive to small frequency errors.

Pulse Modulation

With Option 118 Fast Pulse Modulator fitted the pulse modulation performance is greatly enhanced compared to the standard 2026A/B. This option configuration offers higher on/off ratios of typically >80 dB with faster rise and fall times of 20 ns, typically 15 ns.

FSK

In addition to the analog FM facilities, the 2026A with Option 118 supports 2 and 4-level FSK signals from external logic inputs. The FM deviation generated is set by keyboard entry of the required deviation. The facility is ideal for testing paging receivers and RF modems.

HIGH SPECTRAL PURITY

Measurement of receiver selectivity and ultimate signal-to-noise ratio requires good spectral purity. The 2026A with Option 118 has a low residual FM of typically 3 Hz and typical sideband noise of -121 dBc/Hz at 20 kHz offset from 1 GHz, to allow demanding measurements to be made.

Programming

A GPIB interface is fitted so that all standard signal generator functions are controllable over the bus. The protocol and syntax of GPIB commands has been designed in accordance with IEEE 488.2 standard to facilitate the generation of ATE programs.

Low Cost of Ownership

An electronic trip protects the individual source outputs against the accidental application of reverse power.
Careful attention to the thermal design and the use of well-proven signal generator modules gives high reliability and calibration validity.

The use of flash memory and software download via the RS-232 interface means the 2026A with Option 118 can be upgraded with its covers fitted.

OPTIONS

Option 001 - Third Source
The 2026A as standard is supplied with two RF sources. A version with 3 sources is available as an option.

Option 003 - High Stability Time Base
For applications requiring improved frequency stability and close-in phase noise, the standard TCXO can be replaced by a high-performance OCXO.

Option 004 - Rear Panel Connections
The RF connectors for all sources, their associated modulation and pulse inputs and the combiner output connector can be mounted on the rear panel for ease of use within an ATE environment, as a factory option.

Option 118 - Fast Pulse Modulator
This option when fitted replaces the standard 2026A pulse modulator with a high performance modulator with much enhanced carrier on/off ratio and improved pulse rise and fall times.

SPECIFICATION

GENERAL DESCRIPTION

The 2026A MultiSource Generator with Option 118 contains synthesized signal generators offering up to three independent RF sources with separate outputs or one or more of the signals routed via a combiner. 2026A Signal Generators cover the frequency range 10 kHz to 2.05 GHz. Each signal source can be controlled independently in frequency and level and each has its own amplitude, frequency, phase and pulse modulation capability. All parameters can be entered from the front panel keyboard and a rotary control can be used to adjust most settings. The following signal generator specifications apply to all of the sources fitted.

CARRIER FREQUENCY

Range
10 kHz to 2.05 GHz with a resolution of 1 Hz (2026A)

Accuracy
As frequency standard

RF OUTPUT

Output Range

<table>
<thead>
<tr>
<th>Freq Range</th>
<th>Individual</th>
<th>Combiner</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 kHz - 1 MHz</td>
<td>-140 to +24 dBm</td>
<td>Unspecified</td>
</tr>
<tr>
<td>1 MHz - 1.2 GHz</td>
<td>-140 to +24 dBm</td>
<td>-140 to +10 dBm</td>
</tr>
<tr>
<td>1.2 GHz - 2.05 GHz</td>
<td>-140 to +18 dBm*</td>
<td>-140 to +4 dBm**</td>
</tr>
</tbody>
</table>

Maximum output is further reduced by 3 dB when Pulse modulation is selected and/or by up to 6 dB when AM is selected dependant upon AM depth.

* Uncalibrated above +18 dBm - settable to +24 dBm
** Uncalibrated above +4 dBm - settable to +10 dBm

Resolution
0.1 dB

RF Level Units

Units may be set to µV, mV, EMF or PD; dB relative to 1 µV, 1 mV, EMF or PD; or dBm. Conversion between dB and linear units may be achieved by pressing the appropriate units key (dB or V, mV, µV). The output level can be normalized for 75 Ω operation with an optional external impedance converter (applies to all outputs simultaneously).

RF Output Accuracy (over temp. range 17 to 27°C)

</tbody>
</table>

RF level tracking (over temp range +18 to +28°C)

Relative level accuracy between any two or more combined signals (of equal amplitude) is typically:

<table>
<thead>
<tr>
<th>RF level</th>
<th>1 MHz to 1.2 GHz</th>
<th>1.2 GHz to 2.05 GHz</th>
</tr>
</thead>
<tbody>
<tr>
<td>-18 dBm to +4 dBm</td>
<td>±0.3 dB</td>
<td>±0.6 dB</td>
</tr>
<tr>
<td>&lt; -18 dBm</td>
<td>±0.6 dB</td>
<td>±1.2 dB</td>
</tr>
</tbody>
</table>
**Attenuator hold**
Inhibits operation of the step attenuator from the level at which the key is enabled. Useable for a level reduction of at least 10 dB. Typical accuracy ±3 dB.

**VSWR**
*Individual outputs*
For output levels less than -5 dBm, output VSWR is less than 1.5:1 for carrier frequencies up to 1.2 GHz and less than 1.7:1 for carrier frequencies up to 2.05 GHz.

*Combined output*
Output VSWR is less than 1.22:1 for carrier frequencies between 1 MHz to 1.2 GHz and less than 1.32:1 for carrier frequencies up to 2.05 GHz.

**RF Output connector**
50 Ω type N connector to MIL 390123D

**Output protection**
*Individual outputs*
Protected from a source of reverse power up to 50 W from a source VSWR of 5:1. Protection circuit can be reset from the front panel or via the GPIB or RS-232 interface.

*Combined output*
No reverse power protection. Maximum total safe power 0.5 W.

**SPECTRAL PURITY**

**Harmonics (above 1 MHz)**
*Individual outputs:*
Typically better than -30 dBc for RF level up to +6 dBm, typically better than -25 dBc for RF levels up to +18 dBm (+12 dBm above 1.2 GHz).

*Combined output:*
Typically better than -30 dBc for RF level up to -18 dBm, typically better than -25 dBc for RF levels up to +4 dBm, (-2 dBm above 1.2 GHz).

**Non-Harmonics (for offsets >3 kHz)**
Better than -70 dBc to 1 GHz, better than -64 dBc above 1 GHz

**Isolation**
Better than 80 dB between individual outputs in use
Better than 60 dB from a used individual output and the combiner output
Better than 40 dB between the combiner output and an unused individual output

**Intermodulation**
At an RF output level of 0 dBm on the combiner into a load VSWR of 2.1 or better.

<table>
<thead>
<tr>
<th>Frequency Range</th>
<th>Two Tone Intermodulation*</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 MHz to 2.05 GHz</td>
<td>&lt; -80 dBc</td>
</tr>
<tr>
<td>5 MHz to 10 MHz</td>
<td>&lt; -75 dBc</td>
</tr>
</tbody>
</table>

* Third order intermodulation products for tone spacings ≥30 kHz

**Residual FM (FM off)**
Less than 4.5 Hz RMS deviation in a 300 Hz to 3.4 kHz unweighted bandwidth at 1 GHz
Typically <1 Hz at 249 MHz, <2 Hz at 501 MHz, <3 Hz at 1001 MHz, <6 Hz at 2001 MHz

**SSB phase noise**
Better than -124 dBc/Hz at 20 kHz offset from a carrier frequency of 470 MHz, typically -121 dBc/Hz at 20 kHz offset from a carrier frequency of 1 GHz.

**Carrier Leakage**
Less than 0.5 µV PD at the carrier frequency in a two turn 25 mm diameter loop 25 mm from the surface of the signal generator.

**MODULATION CAPABILITY**

FM, AM or phase modulation can be applied to the carriers generated by each signal source from independent internal or external modulation sources. The internal modulation sources are capable of generating two simultaneous signals into any one of the modulation channels. Each internal and external modulation source can be simultaneously enabled to produce combined amplitude and frequency (or phase) modulation. Pulse modulation can be applied to each of the carriers from external pulse sources. The pulse modulation can be used in combination with the other forms of modulation. 2 level or 4 level FSK modulation can be applied to each carrier using data from an external source.

**FREQUENCY MODULATION**

**Accuracy at 1 kHz**
±5%

**Bandwidth (1 dB)**
DC to 275 kHz (DC coupled)
10 Hz to 275 kHz (AC coupled)
20 Hz to 275 kHz (AC coupled with ALC)

**Group delay**
Less than 5 µs to 100 kHz

**Carrier frequency offset (DC coupled)**
Less than 1% of the set frequency deviation

**Distortion**
<1% at 1 kHz rate for deviations up to 20% of max available deviation, typically 0.1% for deviations of 2% of max available deviation and <3% at max available deviation

**Modulation source**
Internal modulation oscillator or external via front panel BNC
**FSK**

**Modes**
- 2 level or 4 level FSK, external data input via a 25 way rear panel D Type connector

**Frequency shift**
- Variable up to ±100 kHz

**Accuracy**
- As FM deviation accuracy, timing jitter ±3.2 µs

**Filter**
- 8th order Bessel BW 3.9 kHz

**PHASE MODULATION**

**Deviation**
- 0 to 10 radians, resolution 3 digits or 0.01 radians

**Accuracy at 1 kHz**
- ±5% of indicated deviation excluding residual phase modulation

**3 dB Bandwidth**
- 100 Hz to 10 kHz

**Distortion**
- Less than 3% at 10 radians at 1 kHz modulation rate. Typically <0.5% for deviations up to 1 radian at 1 kHz

**Modulation source**
- Internal LF generator or external via front panel BNC

**AMPLITUDE MODULATION**

**Individual Outputs**
- For carrier frequencies <500 MHz useable to 2.05 GHz

**Combined Output**
- Unspecified below 5 MHz useable to 1 MHz, otherwise as individual outputs

**Range**
- 0 to 99.9%, resolution 0.1%

**Accuracy**
- ±5% of set depth at 1 kHz, over temperature range 17°C to 27°C
  - Temperature coefficient < 0.02%/°C

**1 dB Bandwidth**
- DC to 30 kHz (DC coupled)
- 10 Hz to 30 kHz (AC coupled)
- 20 Hz to 30 kHz (AC coupled with ALC)

**Distortion**
- <1.5% at 1 kHz rate for modulation depths up to 30%
- <2.5% at 1 kHz rate for modulation depths up to 80%

**Modulation source**
- Internal LF generator or external, via front panel BNC

**PM on AM**
- Typically 0.1 radians at 30% depth at 470 MHz

**PULSE MODULATION**

With Option 118 fitted the pulse modulation performance of 2026A is as follows:

**Frequency range**
- 100 kHz to 2.05 GHz (useable to 10 kHz)

**RF level accuracy**
- Additional ±0.01 dB/°C temperature coefficient when pulse enabled
  - When pulse modulation is enabled, adds ±0.25 dB to the RF level accuracy specification for carrier frequencies below 10 MHz.

**On/Off ratio**
- >80 dB below 1.2 GHz
- >70 dB up to 2.05 GHz (typically >80 dB)

**Rise & fall times**
- ≤20 ns typically 15 ns

**Maximum repetition frequency**
- 10 MHz

**Control**
- 50 Ω input impedance. A logic 0 (0 V to 0.8 V) turns the carrier off, a logic 1 (2.0 V to 5 V) turns the carrier on.
  - Maximum input is ±10 V.

**RF output range**
- Maximum output level is reduced by 3 dB when Pulse Modulation is selected.

**MODULATION OSCILLATOR**

The internal modulation oscillator for each signal source is capable of generating one or two modulation tones simultaneously in one modulation channel.

**Frequency range**
- 0.01 Hz to 20 kHz with a resolution of 0.01 Hz, frequency accuracy as frequency standard

**Distortion**
- Less than 0.1% THD at 1 kHz

**Waveforms**
- Sine wave to 20 kHz and a triangular or square wave to 3 kHz

**Square wave jitter**
- <6.4 µs on any edge

**Audio Output**
- The modulation oscillator signal from each source is available on the front panel Modulation Input/Output BNC connector at a nominal level of 2 V RMS EMF from a 600 Ω source impedance.

**EXTERNAL MODULATION**

Input on the front panel Modulation Input/Output connector. The modulation is calibrated with 1.414 V peak (1 V RMS sine wave) applied. Input impedance is 100 kΩ nominal. Maximum safe input ±15 V.

**MODULATION ALC**

The external modulation input can be levelled by a peak levelling ALC system over the input voltage range of 0.75 V to 1.25 V RMS sine wave. High and low indicators in the display indicate when the input is outside levelling range.
**Sweep Mode**

The carrier frequency of one source can be swept. To enable more than one source to be swept the coupling facility must be invoked.

The start/stop values of carrier frequency, frequency step size and time per step can be set.

**Step Time**

50 ms to 10 s per step

**Trigger**

A trigger input is available on a rear panel BNC connector and can be used in single, continuous, start/stop or single step mode.

**Frequency Standard**

**Frequency Standard (TCXO)**

Frequency 10 MHz

**Temperature Stability**

Better than ±7 in 10⁶ over the operating range of 0 to 55°C

**Ageing Rate**

Less than ±1 in 10⁶ per year

**External Input/Output**

Rear panel BNC connector accepts an external input of 1 MHz or 10 MHz at a level of 220 mV RMS to 1.8 V RMS into 1 kΩ. Rear panel BNC connector provides an output of 10 MHz at a nominal level of 2 V pk-pk into 50 Ω.

**External RF Input**

The following applies when an external input is connected at the rear panel.

| Insertion Loss | 15 dB ±1.5 dB |
| Frequency Range | 1 MHz to 3 GHz |
| Return Loss | >20 dB to 2.05 GHz |
| Max Input Power | 0.5 W |

**General**

**GPIB Interface**

All signal source parameters except the supply switch are remotely programmable.

Designed in accordance with IEEE 488.2.

**RS-232**

All signal source parameters except the supply switch are remotely programmable.

Connector is 9 way D type, baud rate 300 to 9600 bits per second. Handshake hardware is DTR, RTS, CTS and DSR and software is XON and XOFF. Electrical interface is to EIA-232-D.

**Electromagnetic Compatibility**

Conforms with the protection requirements of Council Directive 89/336/EEC. Complies with the limits specified in the following standards:

IEC/EN61326-1 : 1997, RF Emission Class B, Immunity Table 1, Performance Criteria B

**Safety**

**Rated Range of Use**

(Over which full specification is met unless otherwise indicated.)

Temperature 0 to 55°C, Humidity up to 93% at 40°C
Altitude up to 3050 m (10,000 ft)

**Conditions of Storage and Transport**

Temperature -40 to +71°C, Humidity up to 93% at 40°C
Altitude up to 4600 m (15,000 ft)

**Power Requirements**

AC Supply

90 to 132 V or 188 to 255 V, 47 Hz to 63 Hz, 250 VA maximum

**Calibration Interval**

2 years

**Dimensions and Weight**

(over projections but excluding front panel handles)

**Options**

**Option 001 - 3 Source Signal Generator**

Includes 3 signal sources

**Option 003 - High Stability Frequency Standard**

Replaces the internal TCXO with a high stability OCXO. Specification as standard instrument with the following exceptions:

**Ageing Rate**

±2.5 in 10⁷ per year, <±5 in 10⁸ per day after two months continuous use

**Stability**

Better than ±5 in 10⁸ over the temperature range 0 to 50°C

**Warm Up Time**

Within 2 in 10⁸ of final frequency 10 minutes after switch on at a temperature of 20°C

**Option 004 - Rear Panel Inputs**

RF output, modulation input/output and pulse input connectors are transferred to the rear panel. The signal generator specification is not altered.

**Option 118 - Fast Pulse Modulator**

See pulse modulation section.

**Notes**

(1) Does not apply to external RF input signals to combiner.

(2) For RF levels not exceeding +15 dBm (individual output) or +1 dBm (combined output).

Parent company Aeroflex, Inc. ©Aeroflex 2004
Naturally, a variety of interfaces are optionally provided, including IEEE-488 and a user-friendly keyboard. This unique, interactive, modular architecture also allows for easy configurations of OEM or specialized products.

The Best of Both Worlds

A keyboard-controlled version is available where manual control makes sense. The 2200 provides all the performance of the sub-microsecond System Synthesizer and easy to use, incredibly clean, bench synthesizers. The 2200 is like two synthesizers in one; a sub-microsecond switching computer controlled system synthesizer and an IEEE-488 programmable keyboard entry bench synthesizer with extensive sweep and synchronization capability.

You can conveniently use the 2200 for system development with the convenience of keyboard entry of frequency increments and sweeps, as well as IEEE-488 programming. With the flip of a switch, the 2200 becomes a BCD programmable microsecond frequency switching synthesizer. Even if you do not need fast switching, the 2200 is one of the lowest phase noise 18 GHz synthesizers available.

The 2200 provides programmable and keyboard controlled modulation of AM and FM and 1 µsec frequency switching up to 4 GHz.

OEM Configuration Guide

Aeroflex’s modular architecture and iterative frequency plan makes it ideally suited for custom OEM applications. Just two standard modules make up a 10 MHz - 2.3 GHz, 100 MHz resolution OEM synthesizer with the same specifications as the standard family, needing only DC power and Frequency Reference. To obtain finer resolution and/or wider frequency coverage, just add the appropriate standard modules. Factory assistance is available to help you configure an OEM synthesizer which best meets your electrical or environmental specifications.

- O : Optional
- * : Option 112 extends the frequency coverage to 4.599 999 GHz

**RF OUTPUT**

- Level: +10 dBm
- Leveling: ± 2 dB (± 5°C of Calibration Temperature)
- Impedance: 50 Ohm
- Settling time: 2 µsec maximum (1 µsec typ); to be within +/− 2 dB of final amplitude

**FREQUENCY ACCURACY AND STABILITY**

Same as Reference Oscillator

**REFERENCE OSCILLATOR**

- **Internal**
  - 10 MHz quartz oscillator aging rate 5 x 10⁻⁹/day after 24 hours (in normal operating environment)
- **External**
  - Any 5 MHz or 10 MHz Frequency Standard at a level of 0 dBm +/- 2dB

**SWITCHING SPEED**

The 2200 switches between any two frequencies 50 MHz-18 GHz in less than 1 µsec with 1 MHz resolution and 1.2 µsec with 0.1 Hz resolution. The switching time is measured from the time the 2200 receives a strobe command to switch until the phase detector output shows arrival at new frequency. The 2200 is unique: the larger the resolution, the faster the switching speed with 1 GHz resolution or more typically switching in less than 250 nsec.

**PHASE NOISE**

The 2200 provides sub-microsecond switching and superior phase noise performance simultaneously.

Our passion for performance is defined by these three icons: solution-minded, performance-driven and customer-focused.
Synthesizers

2500 OEM Modular Synthesizer

- Truly modular construction
- Wide frequency range from a single unit
- Amplitude levelling
- Hop states faster than 1 Megahop/sec
- Wide variety of standard and custom interface options
- High performance modulation: chirp, pulse, AM and FM
- Highest spectral purity

The Aeroflex 2500 series synthesizers feature superior performance never available before. They stand at the pinnacle of a family of frequency synthesizers that exemplify cutting edge performance. The 2500 series synthesizers are more reliable, ultra-fast, exceptionally clean, and low cost. They are an ideal source for agile radar, radar simulators, radar upgrades, fast antenna, RCS measurements, electronic warfare systems, and ultra-fast ATE. The high-speed source is based on direct-synthesis techniques with generous use of sharp-rolloff bandpass filters for low-spurious performance. The instrument realization is housed in a 3U rack mountable chassis with display, keyboard, IEEE-488 interface, and parallel BCD interface for ultra-fast switching control. The 2500 series technology has been developed to support the most stringent airborne requirements. The architecture as well as the implementation has been specifically geared to furnishing military qualified, high reliable units. The architecture developed around direct analog frequency synthesis is inherently insensitive to vibration - there are no VCOs or sensitive phase lock loops. The components and modules supporting the architecture have also been selected for their rugged and temperature stable qualities. The architecture has been implemented using the most advanced technology presently available.

**Switching Speed**

<200 ns

**Output Power**

+10 dBm (50 Ω) nominal

**Flatness**

±2 dB (±5°C of calibration temperature)

**Amplitude setting**

Within 2 dB of final level <200 ns

**Reference Oscillator**

Internal: 100 MHz Quartz Oscillator, 5 x 10⁻⁸ per day after 30 days in normal operating environment

**External Tuning Input**

±2 VDC, pull range ± 100 Hz per volt nominal at 1 GHz

### Frequency and Accuracy Stability

Same as reference oscillator

### Remote Programming Control Interfaces

20 bits parallel BCD 1, 2, 4, 8 (1 MHz resolution)

Optional 44 bits parallel BCD 1, 2, 4, 8 (1 Hz resolution)

IEEE-488-1978

**Phase Coherence**

Frequency steps of 50 MHz from 4.8 to 13.5 GHz

100 MHz steps from 13.5 GHz and 26.5 GHz (Finer steps possible as a special option - contact factory)

**Spectral Purity**

**Phase Noise**

Absolute SSB Phase Noise in dBC/Hz (includes noise of internal reference)

### Dimensions

16.75” W x 5.22” H x 23.88” D

(42.55 x 13.66 x 60.66)

**Weight**

55 lbs (24.9 kg)

### AVAILABLE OPTIONS

1 Hz frequency resolution

(Limits switching speed to 1 microsecond for steps less than 500 MHz - Does not affect spectral purity or phase noise)

FM Chirp (Wideband FM)

FM Normalized

40 GHz Frequency doubler, +10 dBm, SMA (F) Input, K (F) Output, Rack Mount Unit

(Dimensions: 2.2” H x 19” W x 6” D, weight: <2 lbs)

10 MHz Phase Lock Capability. Internal reference can be phase locked to 10 MHz Signal at 0 dBm ±2 dB.

19 inch standard equipment rack mount slides

### FREQUENCY MODULATION OPTION

#### SENSITIVITY

1.0 V peak for full scale deviation

The amplitude of the FM input signal must be adjusted to obtain the desired deviation according to the output frequency range.

#### Source

External Only

Input impedance: 50 Ω

Modes: DC and AC

#### Frequency Stability

AC Mode - The FM Oscillator is phase locked to the synthesizer reference. Consequently the carrier has the same stability as in CW Mode.

DC Mode - The FM Oscillator Phase Lock is unlocked to introduce the DC or very low frequency FM signal. The oscillator is thus free running.

#### Linearity

<10% for maximum deviation

#### FM Deviation

## Synthesizers

### 2106 Fast Switching Synthesizer

The Aeroflex 2106 RF source represents a milestone in Synthesizer development and reflects years of design experience in Fast Switching Synthesis. Designed specifically to meet the needs of today’s Telecommunications industry, this high speed source offers a cost effective solution without sacrificing performance. The source covers a frequency range of 4.5 MHz to 6.0 GHz with a switching speed of 100 microseconds. Spurious levels are greater than -65 dBc and Phase Noise at 1.0 GHz is greater than -130 dBc/Hz at 10 KHz offset.

### SPECIFICATIONS

#### Frequency Range
4.5 to 6010 MHz

#### Step Size
- 2 Hz to 2000 MHz
- 2 Hz from 2000 to 4000 MHz
- 4 Hz from 4000 to 6010 MHz

#### Power Output
+7 dBm

#### Flatness
±1.5 dB

#### Output Isolation
- 25 dB minimum between ports
- <5 µseconds switching time between ports

#### VSWR
1.8:1

#### External Reference
- 10 MHz, 3 dBm ±4 db, 50 Ohms

#### Frequency Stability
- Same as Reference Oscillator

#### Reference Output
- 10 MHz, +3 dBm ±2 db, 50 Ohms

#### Phase Noise of External Reference
- -130 dBc/Hz 100 Hz offset
- -140 dBc/Hz 1 KHz offset
-143 dBc/Hz 10 kHz offset
-145 dBc/Hz 50 kHz offset

**Switching Time**

- <100 microseconds to within 1.0 radian of final phase

**Output Phase Noise**

Typical Guar.  Guaranteed

Noise Floor (10 MHz Offset):

-140 dBc/Hz 4.5 to 180 MHz
-145 dBc/Hz 180 to 1000 MHz
-147 dBc/Hz 1000 to 2000 MHz
-138 dBc/Hz 2000 to 4000 MHz
-134 dBc/Hz 4000 to 6010 MHz

**Harmonics**

-25 dBc maximum 4.5 to 6010 MHz

Subharmonics

-60 dBc, Typical

-50 dBc Max except for components at FC noted below

@ FC = 4.0 to 4.25, 5F/2 may be -45 dBc

@ Offsets = ± 2.8 MHz from the carrier, spurs will be as follows:

FC < 180 MHz: -60 dBc
180 MHz < FC < 1.0 GHz: -66 dBc
1.0 GHz < FC < 2.0 GHz: -60 dBc
2.0 GHz < FC < 4.0 GHz: -54 dBc
4.0 GHz < FC < 6.01 GHz: -48 dBc

For 1.0 GHz < FC < 2 GHz, fixed spurs at the following frequencies may be -60 dBc:

1175, 1225, 1275, 1325, 1375, 1425, 1475, 1525, 1575 & 1625 MHz

**Spurious**

-65 dBc maximum 4 to 2000 MHz
-60 dBc maximum 2000 to 4000 MHz
-55 dBc maximum 4000 to 6010 MHz

For FC less than 180 MHz a spur may exist between 1609 MHz and 1960 MHz at -35 dBc

A fixed 800 MHz spur may exist at -60 dBc all carrier frequencies

**Residual FM**

<7 Hz 4.5 to 2000 MHz
<16 Hz 2000 to 4000 MHz
<32 Hz 4000 MHz to 6010 MHz

**Frequency Control**

Parallel BCD negative true with strobe. Strobe normally low, trigger on trailing edge

**Remote On/Off (RF)**

O MHz = Off

**On/Off ratio**

< 25 dBc

**Logic Connector**

50 Pin receptacle, AMP 554216-3

**Initialization**

Unit will initialize with RF Off

**Random Vibration** 10 Hz to 300 Hz @ 1.2G RMS

**Power**

105 TO 125 VAC, 50-60 Hz

**Dimensions**

16.75" W X 5.22" H X 23.86" D

**Temperature Range**

+10 °C to +45 °C

**Configuration**

S = Single Synthesizer,
D = Dual, Two independent synthesizers in a common chassis

**PROGRAMMING INPUT**

**(BCD CONNECTOR)**

Note: Mating Connector is 3M P/N 3564-1001 (50 Pin Ribbon. Bail mount, Plug)
As we are always seeking to improve our products, the information in this document gives only a general indication of the product capacity, performance and suitability, none of which shall form part of any contract. We reserve the right to make design changes without notice. All trademarks are acknowledged.

Our passion for performance is defined by three attributes represented by these three icons: solution-minded, performance-driven and customer-focused.
Synthesizers
MS5000-150 Airborne Frequency Synthesizer

The MS5000-150 features superior performance never before available in a synthesizer designed for use in Airborne Fighter Environments. The high-speed source is based on direct-synthesis techniques with generous use of sharp-rolloff bandpass filters for low-sporous performance. The synthesizer covers a range of 9 to 15 GHz with a frequency switching speed of better than 30 ns. Harmonic levels are better than -50 dBc while spurious levels are no worse than -40 dBc. Phase noise at 14 GHz is -120 dBc/Hz offset 10 kHz from the carrier. Compact size, ruggedized construction and light weight make this unit ideal for EW, RWR, ESM, and other military applications.

- Nanosecond Tuning
- Low Phase Noise
- Phase Coherent
- Low Harmonics
- Small Size
- Fighter Environment
- Optional Fixed Outputs
- Other Frequencies Available

Frequency Range
9.0 to 15.0 GHz

Output Step Size
50 MHz, 5 MHz Optional

Power Output
+10 dBm ± 2 dB

Tuning Speed
50 nSec

VSWR
2:1

Phase Coherency
When tuned to a multiple of 100 MHz, the unit will be phase coherent from F1 to F2 and back to F1

Harmonics and Sub-Harmonics
-50 dBc

Spurious
-40 dBc

SSB Phase Noise, Static
See Plot

Fixed Outputs
Optional fixed output frequencies are available if derived from multiples of internal 100 MHz reference.

Tuning Data Input
11 Bit TTL for 5 MHz resolution

Power Supply
+5.0V @ 3.5A, -6V @0.35A, +15V @ 1.4A
Operating Temperature
-40 °C to +85 °C

Dimensions
6.0” X 6.0” X 2.0”

Environmental
Airborne Fighter
The FS-2000 family of OEM Modular frequency synthesizers operates in the frequency of 10 MHz to 18.4 GHz and offers sub-microsecond frequency switching speed, and sub-microsecond level correction, coupled with superb spectral purity. This unique, interactive, modular architecture also allows for easy configurations of OEM or specialized products.

The Best of Both Worlds

A keyboard-controlled version is available where manual control makes sense. The FS-2000B or FS2000C still provide all the performance of the sub-microsecond System Synthesizer and easy to use, incredibly clean, bench synthesizers. The FS-2000B is like two synthesizers in one; a microsecond switching computer controlled system synthesizer and an IEEE-488 programmable keyboard entry bench synthesizer with extensive sweep and synchronization capability.

With the flip of a switch, the FS-2000B becomes a BCD programmable microsecond frequency switching synthesizer. Even if you do not need fast switching, the FS-2000B-18 is one of the lowest phase noise 18 GHz synthesizers available.

The FS-2000 provides programmable and keyboard controlled modulation of AM and FM and 1 µsec frequency switching up to 4 GHz.

OEM Configuration Guide

Aeroflex's modular architecture and iterative frequency plan makes it ideally suited for custom OEM applications. Just two standard modules make up a 10 MHz - 2.3 GHz, 100 MHz resolution OEM synthesizer with the same specifications as the standard family, needing only DC power and Frequency Reference. To obtain finer resolution and/or wider frequency coverage, just add the appropriate standard modules. Factory assistance is available to help you configure an OEM synthesizer which best meets your electrical or environmental specifications.

**RF OUTPUT**

**Level**  
+10 dBm

**Leveling**  
±2 dB (± 5°C of Calibration Temperature)

**Impedance**  
50 Ohm

**Settling time**  
2 µsec maximum (1 µsec typ); to be within +/-2 dB of final amplitude

**FREQUENCY ACCURACY AND STABILITY**

Same as Reference Oscillator

**REFERENCE OSCILLATOR**

**Internal**

10 MHz Quartz Oscillator Aging rate $5 \times 10^{-9}$/day after 24 hours (in normal operating environment)

**External**

Any 5 MHz or 10 MHz Frequency Standard at a level of 0 dBm +/− 2dB

**SWITCHING SPEED**

The FS-2000 switches between any two frequencies 50 MHz-18 GHz in less than 1 µsec with 1 MHz resolution and 1.2 µsec with 0.1 Hz resolution. The switching time is measured: From the time the FS-2000 receives a strobe command to switch until the phase detector output shows arrival at new frequency. The FS-2000 is unique: the larger the resolution, the faster the switching speed with 1 GHz resolution or more, typically switching in less than 250 nsec.

**PHASE NOISE**

The FS-2000 provides sub-microsecond switching and superior phase noise performance simultaneously.

* 560 to 800 MHz: -20 dBc  ** Option 123: -55 dBc  *** FA 4000-1: -50 dBc

**FREQUENCY SWEEP MODES**

**Auto**

Sweep repeats automatically

**Single**

Single sweep activated by front panel keyboard

**Sweep Speed**

Sweep repeats automatically 1 ms, 10 ms and 100 ms per step external

Synchronized variable to 700 µsec per step

In conjunction with above:

**Sweep Up**

Frequency sweeps from lower frequency to upper frequency, then return back to lower frequency.

**Sweep Down**

Frequency sweeps from upper frequency to lower frequency, then returns back to upper frequency.

**Sweep Up/Down**

Frequency sweeps from lower frequency to upper frequency, then from upper frequency to lower frequency.
Number of Steps: Selectable from 1 to 10,000 steps.

Step Size: Selectable, any size consistent with resolution of unit.

Stop Sweep: Causes internal sweep to halt immediately. Return control to command level.
