Tektronix

VM700*T (turbo)*
Video Measurement Set
Option 01
NTSC Video Measurements

Many capabilities in one instrument
- – **Digital waveform monitor**
- – **Digital vectorscope**
- – **Picture Display**
- – **Group delay and frequency response**
- – **Noise measurement set**
- – **Automatic measurement set**

Auto mode
- – **Unattended monitoring of NTSC video signals from studios, STLs, Earth Stations, and transmitters**
- – **User-specified limits**

Measure mode provides graphic display of measurements
- – **ICPM**
- – **K factor**
- – **Differential gain and phase**
- – **Chrominance to luminance delay**
- – **Noise spectrum**
- – **Group delay with sin x/x**
- – **Color bars**
- – **Relative to reference on most measurements**
- – **Configurable for all standard test signals**

Award winning user interface

State-of-the-art architecture

Extremely fast update rate

Parallel and serial printer ports

Three input channels

Channel difference modes

External VGA display port

Fully documented remote control operation

Hardcopy for analysis and documentation

Recognized with eight technical Emmy awards and one Oscar for outstanding contributions to the television industry, Tektronix world class core competencies have enabled it to design and deliver the most comprehensive solutions in the industry.

The VM700T is a product of this core competency. Recognized as the defacto industry standard that keeps pace with evolving customer needs, the VM700T is a total solution for your baseband video and audio[1] monitoring and measurement needs. Features such as an extremely fast and fully automatic measurement mode as well as full manual operation provides the first time user as well as the seasoned professional an unequaled value for their test and measurement investment.

Automatic video measurement set

The VM700T Auto mode makes standard video transmitter measurements quickly and automatically, including those specified in RS-250C/EIA-250C, NTC-7 and RS170A. Both vertical interval and full field measurements can be made and compared with user-defined limits. A dual limit verification system is employed to generate a caution or alarm message when either limit is violated. Reports can be generated and printed automatically at operator scheduled times or triggered from a conditional event.

Graphic displays of measurements

Measure mode provides virtual real time graphic displays of measurement results automatically. Vertical interval or full field measurements including noise spectrum, group delay, K-factor, differential gain and differential phase are presented as clever, easy to understand interactive digital displays. Such displays are indispensable when extremely fast measurement update rates (up to 30 times a second) are required to provide instant feedback of critical adjustments and analysis of signal variations. User definable limits are visually integrated into each graphic display and can be used to trigger a measurement report or a user definable macro function. Such a function can, for example, dial out through

[1] Option 40 audio measurement package.

a modem to report measurement results or control a signal router. A relative to reference mode allows normalizing to a signal source or eliminate signal path errors from the desired measurement. Up to 2 video references can be stored in NVRAM. Additionally, after downloading to a PC through the VM700T FTP driver, the video reference can be uploaded to another VM700T for reuse. A running averaging mode can be used to reduce the effect of noise. When additional measurement data is required a user can custom configure measurement parameters and report format.

A powerful Test Signal search capability quickly and automatically locates and identifies valid test signals required for a selected measurement, eliminating the annoying and time consuming task of manually locating test signals.

Digital waveform monitor/vectorscope

The VM700T Waveform mode application provides real time graphics displays of the video signal allowing many additional measurements to be made manually. Easy to use measurement cursors are available to measure time, frequency and amplitude parameters of a video signal. These cursors allow a very quick and precise location of the 10%, 50% and 90% points on any transition. Cursor mode also employs an automatic calculation in the wave shape in the center of the display. The parameters calculated are sine peak-to-peak amplitude, frequency, and offset from blanking level. This is very useful for frequency response measurements with the Multiburst signal.

The waveform display can be expanded around any point both vertically and horizontally. Since the data is digitized, the display remains bright and easy to ready at all expansion factors. The scales automatically expand with the waveform, so all units are correct as displayed. A channel difference mode (A-B, A-C, B-A, B-C, C-A, and C-B) is also provided. A screen memory selection

enables Envelope mode, which is useful for looking at teletext, Jitter, or other changes over time.

Vector mode provides the normal vectorscope display. The vectors may be rotated or expanded, with the rotation angle and gain values displayed numerically on the screen.

A unique "Find ColorBars" feature searches all video for ColorBars and displays the vectors if found. The vectors can be referenced to either the selected channel's burst or the burst of one of the other two channels or continuous subcarrier. The phase difference between the selected channel and the reference is always displayed.

Select Line in both Waveform and Vector modes can be used to quickly specify any line for display or automatic measurement if it is the proper signal.

Picture mode

The signal source can be quickly verified using the picture display. Additionally, a "bright-up" line select mode allows a user to select any video line for use in Measure mode or for viewing in Waveform or Vector mode.

User programmable functions

Function mode is an extremely powerful feature that allows a user to store a sequence of user operations as a macro function for later "playback."

For example, a set of measurements (complete with hardcopy commands) to be made on a transmitter demodulator video output, could be stored as a function labeled "DEMOD." The function "playback" could then be initiated manually, remotely or completely automatically as a user specified timed event. Function files can be stored as a text file on a PC for editing, copying or uploading to another VM700T. Other function capabilities include controlling of external serial devices such as video/audio routers, switchers, signal generators, telephone modems and many other devices which support RS232 communications.

Hardcopy

All information on the screen may be printed in high resolution graphics on printers supporting PostScript®, Hewlett-Packard® LaserJet™, DeskJet™, and ThinkJet™, or 24-pin Epson® graphics via the Centronics compatible parallel port or standard RS-232C interface.

Automatic measurement results in text format can be printed on most ASCII printers using the parallel or serial ports.

Remote Operation

The VM700T has a powerful and fully documented remote control language. The VM700T can thus be operated from a remote terminal via RS-232C to monitor unattended transmission systems. In addition, all files can be uploaded to a main computer, and downloaded to other VM700Ts. Two different protocols are supported: FTP (File Transfer Protocol) and TELNET. The user can also select a "no protocol" mode of the RS-232C interface when dealing with low baud rates. However, file transfers can only take place with FTP.

Specifications

The performance requirements cited in this section are valid only within the following environmental limits:

Temperature range of 0 to 50 degrees Celsius, with a minimum warm-up time of 20 minutes. The following tables list each measurement and its performance requirement.

The range specifies the extremes between which a measurement can be made.

All measurement accuracies specified are valid only with nominal input signals of 1 volt pk-pk (± 6 dB) with an unweighted signal-t-noise ratio of at least 60 dB on the incoming signal and a termination accuracy of ± 0.025% (Tektronix PN 011-0102-01 or equivalent).
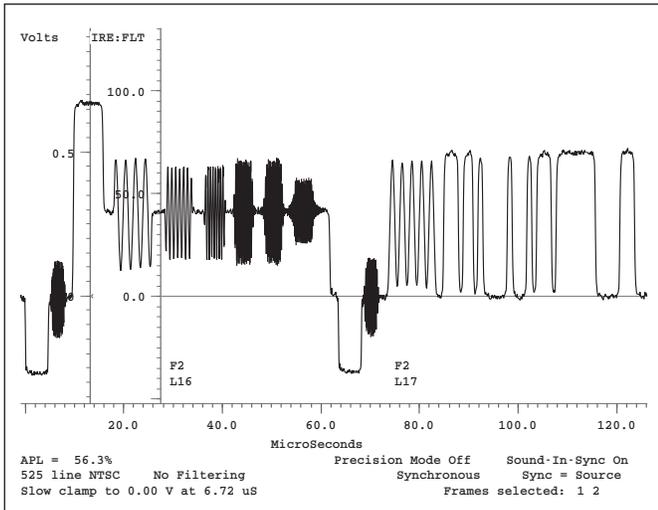

Vertical interval test signals can be seen very clearly for additional analysis of the signal. These can be printed as support documentation for automatic measurement results.
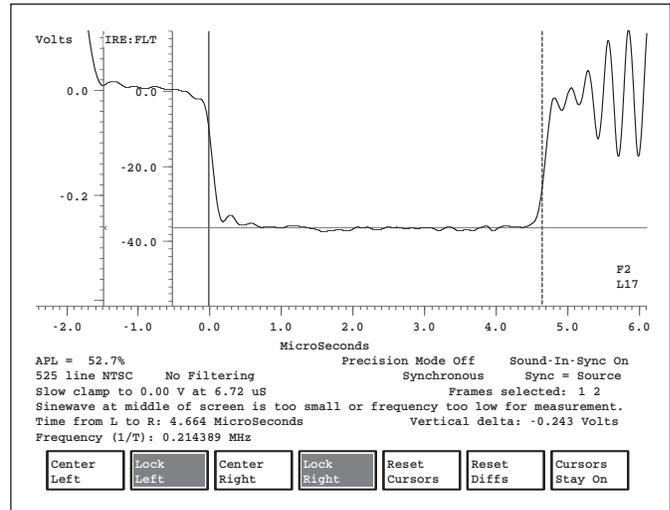

Even a single horizontal synchronization pulse can be displayed at a high intensity.
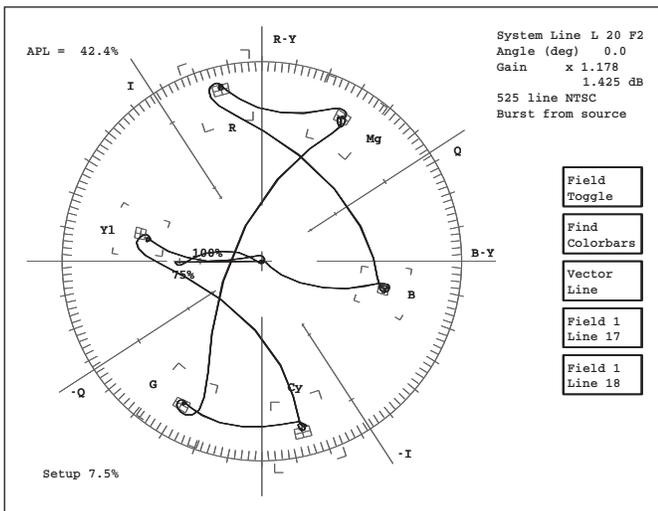

In Vector Mode, the VM700T becomes a digital vectorscope with an electronic graticule. A "Color Bar Search" feature makes it easy to quickly display a line containing a color bar test signal.

Measurement results are displayed in an easy-to-read format indicating the time, signal source, measurement, and whether the measured value exceeded caution (*) or alarm (**) limits.

Measurement Methods — Auto-Mode

The following paragraphs describe the measurement methods for each measurement. Each timing measurement method is written for the FCC method. If there is an RS-170A method for that same measurement, and the RS-170A method differs from the FCC method, the RS-170A requirement is enclosed within square brackets in the FCC description.

Horizontal Interval Timing Measurements

These timing measurements are made within the active picture area, averaging the results over 32 lines starting at line 50 and skipping 1-frame plus 5 lines for each successive sample (i.e., average over line 50 of first field, line 56 of second field, line 62 of the third field, etc.).

Breezeway Width: Measured from the 10% point on the trailing edge of horizontal sync (nominally −4-IRE) to the leading half-amplitude point of the burst envelope.

Color Burst Width: Measured from the leading half-amplitude point on the burst envelope [leading zero crossing of the first half-cycle of burst that exceeds 50% of burst amplitude] to the trailing half-amplitude point on the burst envelope [trailing zero crossing of the last half-cycle of burst that exceeds 50% of burst amplitude].

Front Porch Duration: Measured from the 10% point on the trailing edge of setup (+4 IRE nominally) to the 10% [50%] point on the leading edge of sync (nominally −4 [20] IRE).

Horizontal Blanking Width: Measured between the points on the leading and trailing edges of horizontal blanking that are at an amplitude of 10% [50%] of sync above blanking level (nominally +4 [+20] IRE).

Horizontal Sync Rise Time and Fall Time: Measured between the 10% and 90% points on the leading and trailing edges of horizontal sync, respectively (nominally −4 IRE and −36 IRE).

Horizontal Sync Width: Measured between the 10% [50%] points on the leading and trailing edges of horizontal sync (nominally −4 [−20] IRE).

SCH Phase: Phase at the middle of burst relative to the 50% point on the sync leading edge.

Sync to Setup: Measured from the 10% [50%] point on the leading edge of sync (nominally −4 [−20] IRE) to the point on the trailing edge of blanking that is equivalent to 10% of sync (nominally +4 IRE).

Sync-to-Start-of-Burst: Measured from the 50% point on the leading edge of sync (nominally −20 IRE) to the leading zero crossing of the first half-cycle of burst that exceeds 50% of burst amplitude.

Sync-to-End-of-Burst: Measured from the 10% point on the leading edge of horizontal sync (nominally −4 IRE) to the half-amplitude point on the trailing edge of the burst envelope.

Vertical Interval Timing

Equalizing Pulse Width: Measured between the 10% [50%] points on the equalizing pulse (nominally −4 [−20] IRE).

Serration Width: Measured between the 10% [50%] points of serration (nominally −4 [−20] IRE).

Vertical Blanking Width: Measured between the points on setup [active picture] at a level equal to 10% [50%] of sync amplitude (nominally +4 [+20] IRE), where setup [active picture] immediately precedes and follows the vertical blanking interval.

Color Bar Measurements

Color Bar Amplitude Error: Measured as deviation of the peak-to-peak amplitude of each color bar from the nominal value for that color bar expressed as a percent of the nominal value. Six values reported.

Color Bar Phase Error: Measured as deviation of the phase of each color bar from the nominal phase for that color bar, relative to burst phase. Six values reported.

Color Bar Chrominance-Luminance Gain Ratio: Measured as ratio of chrominance level to luminance level of each color bar, relative to the nominal ratio for each color bar. Six values reported.

Color	Amplitude	Phase	C/L Gain Ratio
Yellow	67.36%	167.59 deg	1.0092
Cyan	94.74%	283.54 deg	1.8045
Green	89.04%	240.67 deg	2.0123
Magenta	89.04%	60.67 deg	2.8957
Red	94.74%	103.54 deg	4.2106
Blue	67.36%	347.59 deg	8.1652

FCC Color Bars Nominal Values
(Source: FCC Rule 73.699, Figure 14).

Amplitude and Phase Measurements (FCC or NTC-7 Composite VITS)

Bar Top: Measured as the ratio of the bar top to Zero Carrier amplitude to the blanking (at back porch) to the Zero Carrier amplitude. Result expressed as a percent of Max Carrier.

Bar Amplitude: Measured from the reference blanking level (at back porch) contained within the test line to the level at the center of the bar.

Burst Amplitude: VITS not required. Burst amplitude must be at least 10 IRE. Measured as peak-to-peak amplitude of the color burst at burst center.

Chrominance-Luminance Delay Inequality (Relative Chrominance Time): Measured as the time difference between the luminance component and chrominance component of the modulated 12.5T pulse.

Chrominance-Luminance Gain Inequality (Relative Chrominance Level): Measured as the peak-to-peak amplitude of the chrominance component of the modulated 12.5T-pulse.

Differential Gain: Measured as the absolute amplitude difference between the smallest and largest staircase chrominance packets. Result expressed as a percent of the largest packet amplitude.

Differential Phase: Measured as the largest difference in phase between any two staircase chrominance packets.

Luminance Non-linear Distortion: Measured as the difference between the largest and smallest step amplitudes of the staircase at the center of each step. Result expressed as a percent of the largest step amplitude difference.

Relative Burst Gain: Measured as the difference between the peak-to-peak amplitude of burst and the staircase chrominance packet located at blanking. Result expressed as a percent of the packet amplitude.

Relative Burst Phase: Measured as the difference in phase between the color burst and the staircase packet located at blanking.

Sync Amplitude: Measured from the tip of the horizontal sync pulse to blanking level.

Blanking Level: Measured as the ratio of the blanking (at back porch) to Zero Carrier amplitude to the sync tip to Zero Carrier amplitude. Result expressed as a percent of Max Carrier.

Sync Variation: Measured as the peak-to-peak variation of the horizontal sync pulse amplitude within every third line of a field.

Blanking Variation: Measured as the peak-to-peak variation of the blanking level within every third line of a field.

Frequency Response Measurements (FCC Multiburst or NTC-7 Combination VITS)

Multiburst Flag Amplitude: Measured from back porch blanking to the center point of the flag top.

Multiburst Amplitude: Measured as the peak-to-peak amplitude of each of the multiburst packets. Six results reported.

Waveform Distortion Measurements (FCC or NTC-7 Composite VITS)

Line Time Distortion: Measured as the peak-to-peak amplitude change of the bar top, excluding the first microsecond and the last microsecond.

Pulse-to-Bar Ratio: Measured as the peak amplitude of the 2T pulse, expressed as a percent of the bar amplitude.

Short-Time Waveform Distortion: Measured as a weighted function of time, the result is the peak deviation from flatness within 1 microsecond of the center of a bar transition. ANSI/IEEE Std.-511-1979, Section 4.4, Appendix B.

Chrominance Non-linear Gain Distortion: Measured as the peak-to-peak amplitude of the first (nominally 20 IRE) and last (nominally 80 IRE) chrominance packets in the 3-level chrominance signal, referenced to the peak-to-peak amplitude of the middle packet (nominally 40 IRE).

Chrominance Non-linear Phase Distortion: Measured as the difference between the largest and the smallest deviation in phase among the 3-level chrominance test signal subcarrier packets.

Chrominance to Luminance Intermodulation: Measured using the 3-level chrominance test signal. Result is the maximum amplitude departure of a filtered part of the luminance pedestal from a part of the pedestal upon which no subcarrier has been superimposed.

2T Pulse K-factor: Measured as the greatest weighted amplitude of a positive-going or negative-going echo-term half-wave which is within one microsecond before the 2T pulse leading edge half-amplitude point or within one microsecond after the 2T pulse trailing edge half-amplitude point. Result expressed as a K-factor which is the ratio of the weighted amplitude of the echo-term half-wave to the sampled amplitude of the 2T pulse.

VIRS Measurements

VIRS Setup (Reference Black): Measured from the blanking level included in the test signal to setup level.

VIRS Chrominance Reference Amplitude: Measured as the amplitude of the VIRS chrominance packet, expressed as a percent of burst (or percent of bar if no burst).

VIRS Chrominance Phase Relative to Burst: Measured as the difference between the VIRS chrominance packet phase and color burst phase.

VIRS Luminance Reference: Measured from the blanking level included in the test signal to luminance reference level (nominally 50 IRE).

Signal-to-Noise Ratio Measurements

Unweighted SNR: Measured as the ratio of bar amplitude to the unweighted rms amplitude of the noise on a quiet line.

Luminance Weighted SNR: Measured as the ratio of bar amplitude to the luminance weighted rms amplitude of the noise on a quiet line.

Periodic SNR: Measured as the ratio of bar amplitude to the peak-to-peak value of the periodic noise.

Out-of-Service Measurements

Long Time Distortion: Measured as the peak overshoot and settling time in a flat field test signal switched from 10% to 90% APL in less than 10 µsec.

Field Time Distortion: Measured as the peak-to-peak amplitude change of the 100 IRE field squarewave top. The first and last 250 µsec are excluded. Expressed as a percent of the field squarewave amplitude.

Power Requirements

Mains Voltage Range — 87 Vac to 132 Vac or 174 Vac to 250 Vac.

Mains Frequency — 47 Hz to 63 Hz.

Power Consumption — 250 Watts.

Environmental

Operating Temperature Range — 0°C to 50°C ambient.

Physical Characteristics

Dimensions	mm	in
Width	483	19.00
Height	222	8.75
Depth	556	21.90

Weight	Kg	lb
Net	≈20	≈45

Ordering Information

VM700T Option 01
NTSC Video Measurement Set

When ordering, please use the nomenclature given here. The standard instrument is shipped as a rack mount product.

Included Accessories

Instruction manual; 75 Ω terminators (3) 011-0102-00; power cord.

Additional Options

Option 11 — PAL Measurements

Option 01/11 — Dual Standard Measurements

Option 20 — Teletext Measurements

Option 21 — Camera Measurements

Option 30 — Component Measurements

Option 40 — Audio Measurement Module

Option 41 — 6 Channel Audio Measurement Module

Option 42 — Audio to Video Delay Measurement

Option 48 — GPIB Interface

Option 1C — Cabinet Version

Option 1G — Echo/Rounding Measurements

Option 1P — Printer

Option 1Z — Probe Adapter (067-1429-00)

Option 3Z — Probe Adapter (3 each of 067-1429-00)

VM700T Software Utilities

VMBKUP — VM700T Backup Utility

VMREMGR — Remote Graphics Software for the VM700T

VMT — VM700T Remote Control Software

Optional Accessories

VM7FC1 — Field installable conversion kit to convert rack mount unit to cabinet.

VM7FR1 — Field installable conversion kit to convert cabinet to rack mount unit.
