

Measuring electric fields from 100 kHz to 3 GHz

using instruments in the NBM-500 family

- ▲ **General public and occupational field exposure from broadcasting, telecoms and industrial equipment**
- ▲ **Isotropic (non-directional) measurement**
- ▲ **64 dB dynamic range without changing measurement range**
- ▲ **Maximum sensitivity starts at 0.2 V/m**

The probe contains three orthogonally arranged dipoles with detector diodes. The three voltages, corresponding to the spatial components, are available individually at the probe output. The NBM basic unit calculates the resulting isotropic field strength.

APPLICATIONS

The probe detects electric fields from 100 kHz to 3 GHz, covering the fields that occur in broadcasting, telecoms, and industry. The high sensitivity of 0.2 V/m and excellent linearity make it ideal for measuring human safety limit values in the general public domain.

PROPERTIES

The probe is designed with mechanical and electrical properties ideal for field use. The probe head is made of foam material to provide effective protection for the sensors, while having excellent RF characteristics. The electric destruction limits for pulsed and continuous wave signals are several times higher than any of the human safety limit values.

CALIBRATION

The probe is calibrated at several frequencies. The correction values are stored in an EPROM in the probe and are automatically taken into account by the NBM instrument. Calibrated accuracy is thus obtained regardless of the combination of probe and instrument.
